On a visit to the property the environmental professional shall visually and/or physically observe the property and any structure(s) located on the property to the extent not obstructed by bodies of water, adjacent buildings, or other obstacles. The periphery of the property shall be visually and physically observed, as well as the periphery of all structures on the property. On the interior of structures on the property, accessible common areas expected to be used by occupants or the public, maintenance and repair areas including boiler rooms, and a representative sample of occupant spaces, should be visually and/or physically observed. (ASTM Standard E1527-13)

A Site visit was conducted on November 5, 2018 by Ian Cannan of Tetra Tech. At the time of the Site visit the skies were overcast with cool temperatures (40-50º F) and intermittent rain showers. Mr. Ernest J. Daviero (owner of 1711 State Highway 5S) and Mr. John Frasier (owner of 1733 State Highway 5S) accompanied Mr. Cannan during the portions of the Site visit on their respective properties. The unoccupied portions of the Site were visually inspected by Mr. Cannan via available access points and public roadways. The Site visit was limited by overgrown vegetation and scrub brush along the borders of developed properties and covering much of the undeveloped properties. Where accessible, crop lands (or cleared and mowed fields) were observed from public access points and interior roadways. The interior portions of crop lands (or vacant fields) were viewed from a distance due to limited accessibility. We note that Assessor Parcel 55.-1-1.1 includes fields/crops and an associated dairy farm. However, for the purpose of this report the "Site" was limited to the portion of this property that lies north of the tributary to South Chuctanunda Creek that flows easterly through this parcel. Therefore, a detailed inspection of the dairy farm operations and associated buildings was not performed as part of this Site visit.

BUILDING DESCRIPTION

The locations of the buildings are shown on Figure 2.

Assessor Parcel ID	Building ID	Date Constructed	Utilities	Heated/Cooled
54.-1-35.131	1. Single Family Home	1991	electric, solar electric, private septic, public water, private water	hot water (oil)/No
54.-1-35.131	2. Detached Garage	1994	electric	No
54.-1-35.131	3. Shed	Mid-1990s	None	No
54.-1-35-151	1. Single Family Home	1989	electric, public water, public sewer, private septic, private water	forced hot air (wood, oil, propane)/No
54.-1-35-151	2. Detached Garage	1998	electric	No
54.-1-35-151	3. Lean-to	Mid-1990s	None	No
54.-1-35.141	1. Farm Stand Building	1999	None (former electric)	No
54.-1-35.141	2. Shed	Presumed 1999	None	No
55.-2-4.1	1. Pole Barn	1996	None	No

HAZARDOUS SUBSTANCES AND PETROLEUM STORAGE

	Yes	No	NA
Hazardous substance or petroleum drums or containers ≥ 5 gallons capacity?	☐	☒	☐

No oil or hazardous substance containers greater than 5-gallons were identified at the Site.

	Yes	No	NA
Hazardous substance or petroleum containers ≤ 5 gallons capacity?	☒	☐	☐

Small containers for the storage of common household chemicals and motor fuels (e.g. gasoline for lawn mowers) were identified at Assessor Parcel 54.-1-35.131 and Assessor Parcel 54.-1-35-151.

EVIDENCE OF STORAGE TANKS

	Yes	No	NA
Aboveground storage tanks?	☒	☐	☐
Underground storage tanks?	☐	☒	☐
Vent pipes?	☒	☐	☐
Fill pipes?	☒	☐	☐
Access ports?	☐	☒	☐

At Assessor Parcel 54.-1-35.131 (1711 State Highway 5S) home heating oil is stored in a 250-gallon above-ground storage tank (AST) in the basement of the residence. The AST was observed to be in average condition and no visible defects or active leaks of oil were observed. The oil filter and oil supply line were connected to the bottom of the AST. The heating oil AST was connected via an above-ground copper supply line to the boiler that is used to heat the residence. During the interview Mr. Daviero indicated that the oil AST is as old as the house (early 1990s). Also, Mr. Daviero stated that they have been keeping the oil level in the tank low recently, and the tank was observed to be less than 1/3 full at the time of the Site visit. There was no staining, petroleum odors or other evidence of a release of oil from the AST. Water moisture was observed on the exterior top of the AST, proximate to the fill and vent pipes. This AST is not considered a REC, historical REC, or de minimis condition.

The property identified as Assessor Parcel 54.-1-35-151 (1733 State Highway 5S) also has a 250-gallon home heating oil AST in the basement of the residence. The AST was observed to be in average condition and no visible defects or active leaks of oil were observed. The heating oil AST was not connected to the furnace and the connection point was capped at the bottom of the AST. During the interview Mr. Frasier indicated that the oil AST is believed to be original to the house. Mr. Frasier indicated that the heating oil AST has not been used for 2 or 3 years. Following the use of oil, the heating system was connected to propane; however, the propane system and tank were removed, and heating is currently via a wood pellet stove. Mr. Frasier also indicated that the heating oil AST contains some residual oil, and at the time of the Site visit the tank was observed to be less than ¼ full. This AST is not considered a REC or historical REC, based on the available information and observations as documented

in this report. The presence of the unused former AST with residual stored oil is considered a *de minimis* condition.

SOLID WASTE DISPOSAL

	Yes	No	NA
Evidence of filling, grading, mounds, depressions or dumping suggesting trash construction debris, demolition debris, or solid waste disposal?	☒	☐	☐

No areas of filling or significant soil waste disposal were identified or visually/physically observed during the Site visit. A small accumulation of used tires was observed at Assessor Parcel 55.-2-4.1 at the central-eastern boundary of the property. The presence of a small accumulation of used tires at Assessor Parcel 55.-2-4.1 is considered a *de minimis* condition.

INDICATIONS OF PCBS

	Yes	No	NA
Electrical or hydraulic equipment known or likely to contain PCBs?	☐	☒	☐

VISIBLE STAINING AND ODORS

☒	Stains or corrosion	☐	Stressed vegetation
☒	Stained soil or pavement	☐	Strong, pungent, or noxious odors

Visible water moisture was observed on the top and sides of the heating oil AST at the property identified as Assessor Parcel 54.-1-35.131 (1711 State Highway 5S). No oil/petroleum stains or odors were observed on the concrete floor beneath the water stain. There were no oil/petroleum stains along the length of the oil supply line from the AST to the boiler and no staining was observed proximate to the boiler. Also, the heating oil AST at this property had some visible evidence of corrosion (rust) along the edges of the end of the tank. However, there were no significant pits or areas of corrosion, and it is believed that the corrosion is consistent with the suspected age of the tank. This apparent water staining is not considered a REC, historical REC, or de minimis condition.

Visible oil staining was observed under the heating oil AST at the property identified as Assessor Parcel 54.-1-35-151 (1733 State Highway 5S). It was difficult to discern the extent of the staining that was attributable to oil vs. water stains which were observed in three separate areas of the basement at the time of the Site visit. There were no strong, pungent or noxious odors associated with the oil stain. No oil/petroleum staining was observed proximate to the furnace or between the AST and the furnace. During the interview Mr. Frasier indicated that the staining under the heating oil AST was associated with minor drips of heating oil during replacement of the oil filter at the bottom of the AST. Also, the heating oil AST at this property had some visible evidence of corrosion (rust) along the surface of the tank. However, there were no significant pits or areas of corrosion on the tank, and it is believed that the corrosion is consistent with the suspected age of the tank. The presence of the unused former AST with residual stored oil and residual oil staining of the concrete surface is considered a *de minimis* condition.

Evidence of visible staining was observed on the wood floor of the shed at the property identified as Assessor Parcel 54.-1-35.141. Several empty containers were observed inside the shed as well as a pile of debris. Upon inspection the stains were believed to be associated with water and there were no strong, pungent or noxious odors associated with the staining. This apparent water staining is not considered a REC, historical REC, or de minimis condition.

WATER AND WASTEWATER

☒	Standing surface water, pools of liquid	☐	Dry wells
☐	Floor drains	☒	Pits, ponds, lagoons
☒	Drains, ditches or streams	☒	Wells
☒	Sumps	☒	Septic systems, cess pools
		☐	Underground injection system

The following describes the observed conditions related to water and wastewater during the Site visit:

- **Assessor Parcel 54.-1-35.131 (1711 State Highway 5S)**
  - This property has a private septic system for the on-site disposal of sanitary wastewater. During the interview Mr. Daviero indicated that there have been no issues with the septic system and the septic tank was pumped out earlier in 2018. The location of the septic tank was observed. Proximate to the cover for the septic system some pooled rain water was observed. The standing water is suspected to be associated with recent rainfall. There were no strong, pungent or noxious odors, and no evidence of releases of oil or hazardous substances was discernable in the area of the septic system.
  - Standing water and a water stain was observed proximate to a sump in the basement of the residence. The sump is located west of the AST in the northwest corner of the basement. The water in the sump was clear and there was no visible sheen, staining or strong, pungent or noxious odors associated with the sump.
  - A low area and possible drainage pathway was observed in the southwestern portion of the property, behind the garage. Standing water was present proximate to the drainage ditch. The standing water is suspected to be associated with recent rainfall. The water was clear and there was no visible sheen, staining or strong, pungent or noxious odors associated with this area.
  - This property formerly utilized a private drinking water well; however, according to Mr. Daviero, the property was connected to the municipal water supply system several years ago.

- **Assessor Parcel 54.-1-35-151 (1733 State Highway 5S)**
  - This property formerly utilized a private septic system for the on-site disposal of sanitary wastewater. During the interview Mr. Frasier indicated that the system was converted to the municipal sewer system when a nearby commercial development was constructed in the late 1990s or early 2000s. The area of the former septic system was observed and there was no visible staining and there were no strong, pungent or noxious odors, and no evidence of releases of oil or hazardous substances was discernable in the area of the septic system.

  - This property formerly utilized a private drinking water well; however, according to Mr. Frasier, the property was connected to the municipal water supply in the late 1990s or early 2000s. The former well was observed to remain at the property. According to Mr. Frasier the well water had a sulfur odor.
  - Standing water and water staining were observed in the basement of the residence in three separate locations: in the southeast corner (near the AST); in the central western area; and along the northern wall. In the northeast corner a sump was observed with water flowing from the foundation walls into the sump. The water in the sump and the water stains in other areas of the basement were clear and there was no visible sheen, staining or strong, pungent or noxious odors associated with the water in the basement.
  - In the southeasterly portion of the property a man-made (dug) pond was observed. According to Mr. Frasier this area was excavated to make the pond using the naturally clayey soils of the area. There was no visible sheen, staining or strong, pungent or noxious odors associated with the pond.
  - In the eastern portion of the property (proximate to the former drinking water well) there was ponded surface water in low spots in the lawn. It is suspected that these areas of ponded water are associated with low permeability soils and recent rains at the time of the Site visit. There was no visible sheen, staining or strong, pungent or noxious odors associated with the standing water in this area.

- **Assessor Parcel 55.-1-1.1 (176 Mead Road)**
  - An attempt was made to observe the suspected pit/pond in the central portion of this parcel, just north of the stream. This pit/pond is not believed to contain liquids likely to be hazardous substances or petroleum products. There were no strong, pungent or noxious odors associated with this area.

7.0 SITE HISTORY

The objective of consulting historical sources is to develop a history of the previous uses of the property and surrounding area, in order to help identify the likelihood of past uses having led to recognized environmental conditions in connection with the property. All obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, or back to 1940, whichever is earlier. (ASTM Standard E1527-13)

SITE HISTORY

Dates	Use
Late 1800s	Residence constructed at 176 Mead Road (Assessor Parcel 55.-1-1.1) circa 1890, surrounding lands likely developed for agricultural use around this period.
1890 to 1940s	Agricultural use associated with dairy farm at 176 Mead Road. Other parcels undeveloped or farm/crop land.
1942 to 1957	Aerial photos indicate development of pond in the central portion of the 176 Mean Road dairy farm property (Assessor Parcel 55.-1-1.1)
1940s to present	Agricultural use associated with dairy farm at 176 Mead Road. Other parcels undeveloped or farm/crop land.
1989 to present	Residence constructed at 1733 State Highway 5S, Assessor Parcel 54-1-35.151
1991 to present	Residence constructed at 1711 State Highway 5S, Assessor Parcel 54.-1-35.131
1996 to present	Pole Barn constructed at Assessor Parcel 55-2-4.1
1999 to mid-2000s	Farm stand established at Assessor Parcel 54.-1-35.141 (Backyard Gardner Farm Stand)
Mid-2000s to present	Assessor Parcel 54.-1-35.141 has vacant farm stand building and open fields/brush

The Site history was established back to approximately 1890, when a residence was constructed at 176 Mead Road (Assessor Parcel 55-1-1.1). The Site and surrounding lands were likely associated with agricultural or similar low intensity use from the late 1800s to the late 1980s. In the late 1980s and early 1990s residences were constructed at 1733 and 1711 State Highway 5S. Subsequently a farm stand was established Assessor Parcel 54.-1-35.141 in approximately 1999 and was active for a few years and is believed to have ceased operations in the mid-2000s. In the late 1990s or early 2000s municipal water and sewerage were made available during development of the surrounding area for commercial use.

8.0 ADJOINING PROPERTIES

To the extent that indications of current and past uses of adjoining properties are visually or physically observed on the site visit, or are identified in the interviews or record review, they shall be identified in the report if they are likely to indicate recognized environmental conditions in connection with the adjoining properties or the property. (ASTM Standard E1527-13)

CURRENT AND PAST USES OF ADJOINING PROPERTIES

	Address	Current Use	Past Use(s)
North	None	agricultural fields	likely agricultural
North	1800 State Highway 5S	Commercial (Target)	likely agricultural
North	Along Joann Way and Broadway	residential	likely agricultural
South	176 Mead Road	dairy farm	same
South	None	NY State Thruway	likely agricultural
South	Along Snooks Corners Road	agricultural fields	likely agricultural
East	118 Mead road	residential	likely agricultural
West	1767 State Highway 5S	residential	likely agricultural
West	1785 State Highway 5S	Vacant industrial (Lott Holding Corp.)	likely agricultural

GENERAL USES OF THE SURROUNDING PROPERTIES

The general uses of the surrounding properties include rural residential, agricultural and industrial. The most significant nearby use includes a commercial development (Target distribution center) at 1800 State Highway 5S and food products facility at One Nutritious Place (Beech-Nut Nutrition Company).

9.0 REGULATORY REVIEW

The purpose of the records review is to obtain and review records that will help identify recognized environmental conditions in connection with the property. Some records to be reviewed pertain not just to the property but also pertain to properties within an additional approximate minimum search distance in order to help assess the likelihood of an impact to the property from migrating hazardous substances or petroleum products. Government information obtained from nongovernmental sources may be considered current if the source updates the information at least every 90 days or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government makes the information available to the public. (ASTM Standard E1527-13)

A review of standard state and federal environmental record sources pertaining to the Site and surrounding area was conducted using the Environmental Database Resources (EDR) database service. The EDR report was issued on November 2, 2018, using the minimum search distances recommended in the ASTM Standard. The local regulatory review included a New York Freedom of Information Law request to review files at the County of Montgomery and Town of Florida offices. As of the date of this report no response from the Town of Florida has been provided. The County of Montgomery responded that they do not have relevant records and that the Town of Florida is the Records Access Officer for the subject properties. The findings of the regulatory database review and the local records are summarized below. All of the below-listed databases were searched. A check in the boxes below indicates that the Site or a property within the minimum search distance recommended by the ASTM Standard was identified on the specified database. The complete EDR report, which includes descriptions of the databases searched and dates the databases were issued, is in Appendix C. Copies of relevant local records are provided in Appendix E.

REGULATORY AGENCIES LISTING THE SITE

Federal		State		Local	
☐	NPL	☐	Sites	☐	Registered USTs
☐	Delisted NPL	☐	Spills	☐	Tank closure records
☐	CERCLIS	☐	Registered UST	☐	OHM storage records
☐	CERCLIS NFRAP	☐	SWL	☐	Spills / LUSTs
☐	RCRA CORRACTS	☐	PWS	☐	Other
☐	RCRA non-CORRACTS TSD	☐	Institutional/Engineering Controls registry (AULs)		
☐	RCRA Generators	☐	Other		
☐	Institutional/Engineering Controls registry (AULs)				
☐	ERNS				

Federal Databases: The Site was not identified in the federal databases reviewed.

State Databases: The Site was not found listed on the State databases reviewed.

REGULATORY AGENCIES LISTING ABUTTING/SURROUNDING PROPERTIES

Federal		State		Local	
☐	NPL (1.0 mile)	☐	Sites (1.0 mile)	☐	Registered USTs
☐	Delisted NPL (0.5 mile)	☒	Spills (0.5 mile)	☐	Tank closure records
☐	CERCLIS (0.5 mile)	☐	Registered UST (adjoining properties)	☐	OHM storage records
☐	CERCLIS NFRAP (0.5 mile)	☐	SWL (0.5 mile)	☐	Spills / LUSTs
☐	RCRA CORRACTS (1.0 mile)	☐	PWS	☐	Other
☐	RCRA non-CORRACTS TSD (0.5 mile)	☒	NY Petroleum Bulk Storage		
☐	RCRA Generators adjoining properties)	☒	Other		

Federal Databases: According to our review of the federal databases, there are no National Priority List (NPL) sites, delisted NPL sites, Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS), CERCLIS No Further Remedial Action Planned (CERCLIS NFRAP), Resource Conservation and Recovery Act (RCRA) Treatment, Storage, and Disposal (TSD) facilities, RCRA CORRACTS, or RCRA non-CORRACTS facilities, or RCRA Generators within the ASTM specified radii from the Site that required further review regarding potential RECs, HRECs at the Site with the exception of the following:

State Databases: According to our review of the state databases, there were no sites, spills, registered underground storage tank (USTs), solid waste landfills or public water supplies within the specified ASTM radii that required further review regarding potential RECs, HRECs at the Site with the exception of the following:

- **State Spills #9203815:** A spill of 15 gallons of diesel fuel occurred on property adjacent to and south of the Site on July 1, 1992 during a traffic accident involving a commercial vehicle. The oil spill was reported to the New York State Department of Environmental Conservation (NYSDEC). The cleanup was completed on the same day and the record indicates that the cleanup met applicable standards. Therefore, this incident does not represent at REC or HREC at the Site.

- **State Spill # 1110405:** On November 22, 2011, a spill of non-PCB transformer oil was reported to NYSDEC. The spill was related to a leaking transformer at a vacant warehouse building which released approximately 20 gallons of transformer oil. Approximately 5 cubic yards of petroleum-impacted soil were excavated and disposed. The spill report is listed as closed as of March 6, 2012 and the record indicates that no further action is anticipated. Based on the distance from the Site and the quantity of oil released this incident does not represent at REC or HREC at the Site.

- **State Spill # 1406532:** A spill of 5 gallons of petroleum was reported to NYSDEC on September 19, 2014. The spill was related to a leaking fuel line on a commercial truck. The spill was cleaned up via excavation and removal of oil-impacted soil and the record indicates that closure was completed on February 18, 2015. Therefore, this incident does not represent at REC or HREC at the Site.

- **State Spill # 8700862:** A spill of oil was reported to NYSDEC at 1467 State Highway 5S on February 5, 1987. Response actions were undertaken and the matter was closed to the satisfaction of the regulator on June 1, 1987. Therefore, this incident does not represent at REC or HREC at the Site.

- **Petroleum Bulk Storage:** The property identified as 176 Mead Road (Assessor Parcel 55.-1-1.1), also identified as the Floridale Farm, is associated with the NYDEC Petroleum Bulk Storage (PBS) program for three above-ground petroleum storage tanks. Based on the Site visit the portion of 176 Mead Road that was subject to the PBS program abuts the Site to the South. The PBS listing indicates that this facility included one 3,000-gallon diesel AST and one 300-gallon gasoline AST. Both of these petroleum AST were closed in March 2001. There are no records of spills or releases or petroleum associated with this facility. Therefore, this incident does not represent at REC or HREC at the Site.

- **Amsterdam Terminal - NYD037373024:** This property is identified as RD#1 in Amsterdam, NY, and is located approximately 2,000 feet west of and potentially upgradient from the Site. This facility is found on the list of known or suspected hazardous substance waste disposal sites, which also includes delisted Inactive Hazardous Waste Disposal Sites and non-registry sites where EPA Preliminary Assessment or Site Investigation Reports were prepared. This site is eligible to be but will not automatically become a NY State Superfund site. This listing is associated with Prelco Reality & Development Corp. and EPA ID NYD037373024. This incident does not represent at REC or HREC at the Site.

INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

The objective of interviews with local government officials is to obtain information indicating recognized environmental conditions in connection with the property. A reasonable attempt shall be made to interview at least one staff member of any one of the following types of local government agencies: local fire department that serves the property; local health agency; or local/regional office of state health agency having jurisdiction over hazardous waste disposal or other environmental matters in the area in which the property is located; or local agencies responsible for the issuance of building permits or groundwater use permits that document the presence of Activity and Use Limitations which may identify a recognized environmental condition in the area in which the property is located. (ASTM Standard E 1527-13). Many government agencies do not grant interviews, but respond to written requests for information by performing file searches of their records.

The local regulatory review included a New York Freedom of Information Law request to review files at the County of Montgomery and Town of Florida offices. The County of Montgomery responded that they do not have relevant records and that the Town of Florida is the Records Access Officer for the subject properties. As of the date of this report no response from the Town of Florida has been provided.

Limitations

1. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services or the time and budgetary constraints imposed by the CLIENT. The work described in this report was carried out in accordance with the Terms and Conditions in our contract.

2. In preparing this report, ENGINEER has relied on certain information provided by state and local officials and other parties referenced therein, and on information contained in the files of state and/or local agencies available to ENGINEER at the time of the site assessment. Although there may have been some degree of overlap in the information provided by these various sources, ENGINEER did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this site assessment.

3. Observations were made of the Site and of structures on the Site as indicated within the report. Where access to portions of the Site or to structures on the Site was unavailable or limited, ENGINEER renders no opinion as to the presence of hazardous materials or oil, or to the presence of indirect evidence relating to hazardous material or oil, in that portion of the Site or structure. In addition, ENGINEER renders no opinion as to the presence of hazardous material or oil, or the presence of indirect evidence relating to hazardous material or oil, where direct observation of the interior walls, floor, or ceiling of a structure on a Site was obstructed by objects or coverings on or over these surfaces.

4. ENGINEER did not perform testing or analyses to determine the presence or concentration of asbestos at the Site or in the environment at the Site.

5. It is ENGINEER's understanding that the purpose of this report is to assess the physical characteristics of the subject Site with respect to the presence on the Site of hazardous material or oil. This stated purpose has been a significant factor in determining the scope and level of services provided for in the Agreement. Should the purpose for which the Report is to be used or the proposed use of the site(s) change, this Report is no longer valid and use of this Report by CLIENT or others without ENGINEER's review and written authorization shall be at the user's sole risk. Should ENGINEER be required to review the Report after its date of submission, ENGINEER shall be entitled to additional compensation at then existing rates or such other terms as agreed between ENGINEER and the CLIENT.

6. The conclusions and recommendations contained in this report are based in part, where noted, upon the data obtained from a limited number of soil samples obtained from widely spaced subsurface explorations. The nature and extent of variations between these explorations may not become evident until further exploration. If variations or other latent conditions then appear evident, it will be necessary to reevaluate the conclusions and recommendations of this report.

7. Any water level readings made in test pits, borings, and/or observation wells were made at the times and under the conditions stated on the report. However, it must be noted that fluctuations in the level of groundwater may occur due to variations in rainfall and other factors different from those prevailing at the time measurements were made.

8. Except as noted within the text of the report, no quantitative laboratory testing was performed as part of the site assessment. Where such analyses have been conducted by an outside laboratory,

ENGINEER has relied upon the data provided and has not conducted an independent evaluation of the reliability of these data.

9. The conclusions and recommendations contained in this report are based in part, where noted, upon various types of chemical data and are contingent upon their validity. These data have been reviewed and interpretations made in the report. As indicated within the report, some of these data may be preliminary screening level data and should be confirmed with quantitative analyses if more specific information is necessary. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed, and the conclusions and recommendations presented herein modified accordingly.

10. Chemical analyses have been performed for specific constituents during the course of this site assessment, as described in the text. However, it should be noted that additional chemical constituents not searched for during the current study may be present in soil and/or groundwater at the Site.

11. This Report was prepared for the exclusive use of the CLIENT. No other party is entitled to rely on the conclusions, observations, specifications, or data contained therein without the express written consent of ENGINEER.

12. The observations and conclusions described in this Report are based solely on the Scope of Services provided pursuant to the Agreement. ENGINEER has not performed any additional observations, investigations, studies, or testing not specifically stated therein. ENGINEER shall not be liable for the existence of any condition, the discovery of which required the performance of services not authorized under the Agreement.

13. The passage of time may result in significant changes in technology, economic conditions, or site variations that would render the Report inaccurate. Accordingly, neither the CLIENT, nor any other party, shall rely on the information or conclusions contained in this Report after six months from its date of submission without the express written consent of ENGINEER. Reliance on the Report after such period of time shall be at the user's sole risk. Should ENGINEER be required to review the Report after six months from its date of submission, ENGINEER shall be entitled to additional compensation at then existing rates or such other terms as may be agreed upon between ENGINEER and the CLIENT.

14. ENGINEER has endeavored to perform its services based upon engineering practices accepted at the time they were performed. ENGINEER makes no other representations, express or implied, regarding the information, data, analysis, calculations, and conclusions contained herein.

15. The services provided by ENGINEER do not include legal advice. Legal counsel should be consulted regarding interpretation of applicable and relevant federal, state, and local statutes and regulations and other legal matters.

Appendix B

Statement and Qualifications of Environmental Professional

TETRA TECH

John H. Insall LEP
Senior Project Manager

EXPERIENCE SUMMARY

Mr. Insall has 30-years of diversified environmental consulting experience with specializations in site redevelopment, innovative remediation technologies, polychlorinated biphenyl (PCB) investigation and remediation, PCB building materials, hazardous building material evaluation, litigation support, expert witness testimony, and regulatory compliance auditing.

His areas of expertise include:

- In-situ site remediation including chemical oxidation, soil vapor extraction, petroleum remediation.
- Site redevelopment with a focus on re-use and waste minimization using re-use and engineered control strategies.
- Site investigation, evaluation, and remedial investigations.
- Site remediation.
- Underground storage tank management, evaluation, and remediation.
- Compliance auditing with respect to State and Federal regulations.
- RCRA hazardous waste auditing and consulting.
- Extensive experience with the Connecticut Transfer Act, RCRA, TSCA, and other Federal regulations.
- Health and safety management.
- Sustainability and energy optimization.
- Litigation Support/Expert Witness representation
- PCB site investigation, remediation, redevelopment, regulatory negotiation and management.
- Hazardous building materials.

RELEVANT EXPERIENCE

Expert Witness and Litigation Support

Former English Station Power Plant – United States Coast Guard Litigation, Litigation Support, New Haven, Connecticut, 2014 to 2017 - Provided litigation support in defense of the owner of the former English Station power plant. In 2015, the United States Department of Justice (DOJ) filed a cost recovery claim under the Oil Pollution Act (33 U.S.C. §2701 et seq.). The suit sought to recover treble damages for an imminent threat removal action completed by the United States Coast Guard (USCG) in 2014. The property owner filed a countersuit disputing the justification used by the USCG for the removal action. The suit was settled for a fraction of the DOJ claim amount in late 2017.

Former English Station Power Plant – Demolition Contractor Litigation, Expert Witness, New Haven, Connecticut, 2015 to present

Mr. Insall has been providing litigation support and is expected to be disclosed as an expert witness for the former property owner against a

YEARS WITH TETRA TECH

9

demolition contractor regarding the responsible for releasing oil and PCBs at the site in 2011 and 2012. Mr. Insall has been the principal technical representative for the property owner on issues related to the site since 2012.

Confidential Connecticut Municipality, Litigation Support, 2016 to present – Currently providing litigation support to a New Haven County municipality in preparation for a suit against the owner of a heavily contaminated property. The property owner retains liability for a significant release of chlorinated solvents that have migrated off-site and onto nearby properties, affecting Town, State, and private properties. The municipality is the plaintiff and may pursue a CERCLA liability claim against the property owner.

Professional Liability Claim Defense, Litigation Support, Boyle | Shaughnessy Law, CT, 2016 – Provided litigation support for the defendant in a professional environmental engineering liability suit. Mr. Insall prepared a defense to claims made against the defendant (a licensed professional), and provided counter arguments to demonstrate that the defendant acted in a reasonable manner and met the standard of care for services provided.

Contaminated Drinking Water Well Claim, Litigation Support, Jacobi, Case & Speranzini, P.C., 2016-present – Providing litigation support for the plaintiff to recover damages that resulted from a private drinking water well that was contaminated with sodium chloride from snow clearing and disposal operations by a Connecticut municipality. The municipality disposed of snow, ice, and road salt in a right-of-way. The municipality denied that they had cleared and dumped snow in the right-of-way. Mr. Insall is expected to be disclosed as an expert witness for the client in 2019.

Small Manufacturer, Litigation Support, Confidential Client, NJ, 2016-2018 – Provided defense support in a litigation case against a small manufacturer in New Jersey. The manufacturer is accused of causing releases of chlorinated solvents to soil and groundwater from historical releases to a dry-well and hazardous waste underground storage tank. As part of the defense, Mr. Insall established evidence to demonstrate that a preceding site user (a large manufacturer) may have caused or contributed to the release. As a result of Mr. Insall's arguments, the client was successful in negotiating a 50-percent contribution settlement from the former user to pay for cleanup costs associated with historical releases.

Demolition Project, Expert Witness, Garcia & Milas, 2016 to present – Providing on-going litigation support and expert witness services in defense of a demolition contractor in connection with an EPA approved PCB remediation project of a former industrial property. Mr. Insall has been providing litigation support to the client since May 2016 and was disclosed as an expert witness in 2018.

Jacobi, Case & Speranzini, P.C., Expert Witness, Fairfield County, CT, 2016-present – Mr. Insall is providing expert witness services in a litigation case against a municipality (owner) and municipality-controlled development entity (operator) on behalf of a lease holder. The lease holder's space and improvements became unusable after the local Department of Health rendered the space unfit for occupancy due to fuel oil vapors emanating from a suspected underground storage tank release. The lease holder never used fuel oil nor operated underground storage tanks. The lease holder's improvements and business were lost as a result of the Department of Health order. The owner and operator have denied responsibility for the release. Mr. Insall testified in Fairfield Superior Court in June 2018 that failure of the owner/operator to notify the State of Connecticut under spill statute §22a-450 and failure to adequately investigate and remediate the spill resulted in the Client's loss. The court's decision is expected in late 2018.

Connecticut Licensed Environmental Professional (LEP) Services

Mr. Insall has been the LEP of record on dozens of Connecticut Transfer Act sites from 2000 to the present including dry-cleaners, auto body shops, laboratories, and industrial manufacturing plants. In the last two years, Mr. Insall submitted four LEP Verifications and several Form I Transfer Act filings. The Verifications were accepted by the State of Connecticut Department of Energy and Environmental Protection (DEEP). A No Audit Letter was issued for each Verification. The Form I filings were accepted without question.

Redevelopment and Site Remediation

Brownfields Remediation, Queens, NY, 1995 – Conducted a RI/FS at a multi-property Brownfields site in Queens New York for a national developer. After the RI/FS, Mr. Insall supervised soil and groundwater remediation on the property in preparation for unrestricted development of the site as an office building for a Federal facility. Remediation involved soil excavation, ex-situ low temperature thermal desorption, and groundwater treatment. The project was completed for the developer on-time and under budget.

Building Demolition and Redevelopment Services, Confidential Client, Boston, MA, 2016 – Provided consulting services to a private equity firm that planned to acquire a 750,000 square foot industrial plant. The client planned on redeveloping this property into a mixed-use retail and residential development. Mr. Insall supervised the completion of a hazardous building materials survey in preparation for demolition. Part of the effort was to identify building materials that contain PCBs. The scope of work included the collection of approximately 430 building material samples for PCB analysis including paint from structural steel, primer on structural steel, painted concrete, painted sheetrock, painted wood, caulks, attached materials and substrates, asphalt striping, concrete striping, asphalt, concrete, brick, water tank paint, roofing tars, floor tile mastic, painted steel ductwork, catch basin sediment, and stormwater. The results found that approximately 85-percent of the samples contained PCBs at concentrations that are regulated for disposal by the Commonwealth of Massachusetts and/or 40 CFR Part 761. Partner estimated that the cost of demolition waste disposal was approximately $5,000,000 higher than anticipated. The client planned to absorb the cost delta, but terminated the redevelopment project based on low market demand for the development.

PCB Remediation/Site Redevelopment, Central CT, 2006 to 2011 – Worked with the developer and their attorneys to design and negotiate an environmental undertaking agreement (EUA) with a Fortune 100 company to facilitate a private redevelopment project. The site was developed in the 1930s to manufacture machine parts and heavy equipment. Historical operations resulted in releases of chlorinated solvents, metals, petroleum hydrocarbons, cyanide, and PCBs.

The redevelopment project was designed to minimize costs associated with remediation and allow the redevelopment schedule to proceed with minimal interruption as a community retail center. The remediation strategy included soil excavation to the seasonal high-water table, excavation and off-site disposal of TSCA regulated PCB wastes, the collection of Dense Non Aqueous Phase Liquids (DNAPL), and the installation of a vented vapor barrier system to prevent vapor migration into the new structure.

Mr. Insall negotiated with EPA Region I, the State of Connecticut, the City of West Hartford, and a future anchor tenant (a supermarket chain) to allow re-use of PCB building material wastes and soils (<10 ppm) under the new structure and pavement, saving several millions of dollars. In addition, Mr. Insall negotiated with these parties to get approval for the re-use of 15,000-tons of low-level solvent impacted wastes in a landscaped berm, saving the development an additional $2,500,000 in waste disposal costs. The new retail center opened in December 2010, and is fully leased.

Site Characterization and RCRA Hazardous Waste Release Remediation, Confidential Client, North Haven, Connecticut, 2016-2018 - Provided LEP services for a Connecticut Transfer Act site including site characterization and remediation of a former printing facility in North Haven, Connecticut. Releases of RCRA hazardous wastes were identified in an exterior drum storage area. The release was excavated in 2017. Using extensive data analysis, Mr. Insall determined that low levels of tetrachloroethylene in groundwater at the site were not from on-site releases of hazardous waste, but from the adjacent and up-gradient Pratt & Whitney

property. As a result of the work, Mr. Insall was able to bring the site into compliance with Connecticut's Remediation Standard Regulations (RSRs) shortly after a property acquisition at a competitive cost.

Emergency Response Spill Remediation, Former American Standard Site, Plainfield, Connecticut. 2018. – During commercial redevelopment of a former industrial plant, a release of petroleum to soil and groundwater was identified in a former 500,000-gallon Aboveground Storage Tank (AST) containment. The release was reported to the State of Connecticut in May 2018, and petroleum impacted soil and groundwater remediation were completed in June 2018. Approximately 4,000-tons of petroleum impacted soil and 50,000-gallons of contaminated groundwater were removed from the release area. The AST containment is immediately adjacent to a freshwater wetland and surface water body. Mr. Insall presented an argument to the State of Connecticut that residual petroleum in groundwater would naturally attenuate and that further groundwater remediation, beyond dewatering, was not necessary. The State of Connecticut accepted the argument and remediation activities were completed in less than two weeks, saving the client significant time and expense.

Site Characterization and Hazardous Building Materials Survey, Confidential Client, Danbury, Connecticut, 2016 - Provided LEP oversight for a developer during the acquisition of a former industrial manufacturing plant in Danbury. As part of the work scope, Partner conducted a soil and groundwater investigation and hazardous building materials survey. Building materials were evaluated for asbestos, PCBs, mercury, and radioactive isotopes. The survey identified asbestos-containing materials and low levels of PCBs in some building materials. The investigation was completed to ensure that renovation of the building and waste disposal would be conducted in compliance with State and Federal regulations.

PCB Building Materials Sampling, Ansonia and Meriden, CT Brownfield/DECD Redevelopment Sites, 2016 to 2018 – Provided project oversight and technical review of PCBs building material evaluations as a subcontractor to a prime contractor. The investigations were funded under Federal Brownfields and Department of Economic and Community Development (DECD) grants to municipalities. The scope of work included the collection of samples of painted steel, painted concrete, caulks, and window glazing on each property. The surveys found that PCBs existed in building at regulated concentrations. Some of the materials (PCBs >1 and <50 ppm) are not regulated by the Federal PCB regulations contained in 40 CFR Part 761, but are regulated for the purposes of disposal under §22a-463 through 467 of the Connecticut General Statutes.

PCB Site Investigation and Redevelopment, Hartford, CT, 2011 to present – Currently working with a property owner and potential developers to investigate a former aerospace metals recycling facility for PCB contamination and develop a remedial action strategy. The site contains approximately 35-acres of land and is impacted with PCBs from historical operations. Mr. Insall has negotiated an investigation scope of work with Region I EPA under a Consent Order and Final Agreement (CAFO) in 2012, implemented the investigation, and devised a conceptual remediation strategy. Upon selection of a developer (buyer), the strategy will be adapted to the future use to allow most impacted soils to remain in place using redevelopment features such as filling the property to level the grade, new pavement, and new buildings as an engineered control cap.

PCB Site Investigation and Redevelopment, City of Hartford Proposed Parkville Roadway, Hartford, CT, 2015 to 2016 – Mr. Insall was awarded a contract by the City of Hartford to complete an investigation of a proposed roadway through a PCB contaminated property in 2015. The investigation was completed in 2016. The data identified PCBs ≥50 ppm in certain areas of concern, and lower levels of PCBs in other portions of the proposed roadway. The data were used to develop a cost estimate for remediation and roadway redevelopment using different redevelopment scenarios.

PCB Site Investigation and Redevelopment, New Haven, CT, 2011-2014 – Completed an investigation and redevelopment plan for an Amtrak Maintenance of Way (MOW) rail operations base impacted with PCBs. Mr. Insall designed a conceptual remedial approach to construct an engineered cap over the area that can be used as an elevated parking structure, eliminating the need for significant sub-grade excavation. The development plan was submitted to EPA Region I for review. The plan is under State of Connecticut and EPA review.

Residential Brownfields Redevelopment, Norwalk, CT, 1993 to 2006 – Supervised investigation and designed a remedial action plan for an old compressor manufacturing plant where metals, PAHs, PCBs, and chlorinated solvents were released to soil and groundwater. The remedial design was engineered to allow unrestricted residential development and included innovative soil re-use strategies, oxidation of petroleum compounds, removal of volatile chlorinated organics, and the use of a gas and water proof construction membrane to eliminate volatilization into the new structure.

Chromium/Cadmium Remediation, Bloomfield, CT, 2003 to 2013 – Conducted an investigation of a former communications manufacturing plant in Bloomfield, Connecticut and discovered a release of hexavalent chromium and cadmium to groundwater from a former wafer grinding operation. Mr. Insall designed an in-situ metals fixation remediation strategy. The strategy included the in-situ injection of iron sulfate heptahydrate and sodium hydroxide to precipitate dissolved metals to aquifer materials. The strategy was designed to remove metals and fix the source in the saturated zone. The remediation was completed in 2009, and natural attenuation monitoring is being conducted to monitor residual metal concentrations in groundwater.

PCB Remediation, LEP Verification Pending, New Haven, CT, 1999-present – Managing a PCB investigation and remediation project for a responsible party in New Haven, Connecticut. The property is a former brick yard that was filled with high concentration PCB wastes. The property is subject to the Toxic Substances Control Act (TSCA). Mr. Insall developed a strategy to manage PCB wastes in-situ in lieu of excavating the wastes. Mr. Insall and the developer negotiated with EPA Region I to leave most PCB wastes in place under a risk based TSCA approval. EPA Region 1 has indicated that our work plan is acceptable (December 2010) and protective of human health and the environment under 40 CFR 761.61(c). The strategy will allow wastes to remain below the saturated groundwater zone. As a result, the strategy has reduced the remediation cost from approximately $2,000,000 to $600,000.

Tetrachloroethylene (PCE) Release Remediation, Wethersfield, CT, 1997-1999 – Supervised the investigation and remediation of a tetrachloroethylene (PCE) release at a suburban dry cleaning establishment. The project involved dense non aqueous phase liquid (DNAPL) mapping, hydroegeological modeling to evaluate the distribution of the release area, and removal of sub-slab soils beneath the former dry cleaning and drum storage area.

In-Situ Petroleum Oxidation Project, Farmington, CT, 2006 – Designed and implemented an in-situ petroleum oxidation remediation project at a former biotechnology laboratory in Farmington, Connecticut. Historical operations resulted in the release of 25,000-gallons of No. 2 fuel oil to surficial groundwater and a wetland. The groundwater in the area is used for private drinking water supply. Mr. Insall designed a sodium persulfate treatment system to oxidize petroleum in place. The project included the installation and use of 15 injection points to deliver 10,000-gallons of treatment solution. After oxidation, a bioremediation agent was injected to polish remaining petroleum in saturated groundwater.

PCB Remediation, Cornerstone Real Estate Advisers, Stamford, CT, 2006 – Designed and executed a PCB remediation project to remove PCB contaminated soil in support of a large real estate transaction. As part of the project, Mr. Insall coordinated and completed the removal of over 100 tons of PCB impacted soil. The nature of the waste required specialized work practices and disposal. The project was completed in a timely fashion to ensure the sale of a high value piece of real estate. As part of the project, Mr. Insall assisted the client with effecting a transfer of liability from seller to buyer, which allowed the seller to end their involvement in the asset at the closing. The efficiently completed project facilitated a smooth real estate transaction and ended liability for the site for the client.

Pesticide Remediation, South Windsor, CT, 2006 – Designed and executed a pesticide remediation project to allow redevelopment of former agricultural land into a productive residential community. The project involved contaminant delineation; a Remedial Investigation/Feasibility Study (RI/FS) to identify the most cost effective remediation technology; and execution of a soil remediation program. As a result of Mr. Insall's evaluation, remediation costs were reduced from close to $1,000,000 to $80,000. Most of the cost savings were realized by the use of appropriate remediation goals for a non-regulated site rather than the regulatory criteria, which two

other consultants had advocated. The property was subsequently redeveloped and is generating revenue as a residential community.

In-Situ Chemical Oxidation, LEP Verification, 239 West Service Road, Hartford, CT, 2004-2015 – Designed and completed an in-situ chemical oxidation project at a former direct mail printing facility where chlorinated cleaning solvents were discharged to silt and clay deposits. Despite the complexity of native geology and difficulty associated with treating absorbed solvents, the project was successful in reducing chlorinated solvent groundwater concentrations by 75 to 80-percent over a two-year period. Residual solvent concentrations are below site-specific surface water protection criteria and residential volatilization criteria. In 2015, Mr. Insall's LEP Verification was accepted for this project, providing regulatory closure for the site.

Dry Cleaner Remediation, 95 Elm Street, Enfield, CT, 2007-2014 – Reviewed and designed an in-situ chemical oxidation pilot study and treatment design for a chlorinated VOC plume originating at an historical dry-cleaner. The chlorinated plume is up to 0.3-miles long and was treated with a network of sodium permanganate injection points to degrade the chlorinated compounds. The project was completed in 2009 and included the injection of 55,000-gallons of a sodium permanganate oxidant solution in the release area.

150 North Plains Industrial Road, LEP Verification, Wallingford, CT, 2009-2015 – Investigated a mixed-use property with low levels of chlorinated solvents in groundwater. Mr. Insall demonstrated that the release was originating off-site and submitted an LEP Verification for the site in 2015. The Verification was accepted, providing closure for the site.

Chlorinated Solvent and Petroleum Release Remediation, LEP Verification, Berlin, CT, 2006-2015 – Investigated and remediated an industrial brake parts manufacturing plant to remove petroleum and chlorinated hydrocarbon releases at this site. Mr. Insall submitted an LEP Verification for the site in 2015. The Verification was accepted, providing closure for the site under the Connecticut Transfer Act.

Industrial Transformer Release Investigation and Remediation, Confidential Client, 2016 – Mr. Insall was retained to oversee the investigation of a large industrial transformer oil leak. The project included a rapid evaluation of the transformer oil for PCB content to determine if the leak resulted in a spill of PCBs to the environment. The sampling found that the transformer was non-PCB containing. As a result, contaminated soil was excavated and recycled as petroleum contaminated soil.

Former Arch Chemical Site, LEP Verification, Cheshire, CT, 2006-2017 – Mr. Insall completed investigation and remediation of a former research and development laboratory used for chemical research, and more recently, biotechnology product research and development. The site was a RCRA Corrective Action site. RCRA Corrective Action was completed in 2012. Site investigation and remediation under the Connecticut Transfer Act were completed in 2017. The scope of work included a detailed site investigation, soil remediation, data analysis to demonstrate that the site was in compliance with the RSRs using alternate methods, and the submission of a LEP Verification. The LEP Verification was accepted and a Letter of No Audit was received in less than 30-days.

Former Industrial Campus, Hazardous Building Materials Investigation and Remediation, Shrewsbury, NJ, 2016-2017 – Mr. Insall supervised a hazardous building materials investigation and remediation project at a former industrial campus consisting of three multi-tenant industrial buildings to facilitate demolition. The investigation included building material sampling for mercury, lead, and asbestos. PCBs in building materials were not identified as a concern based on the date of construction. Mr. Insall determined that waste disposal would not require compliance with the disposal requirements for bulk product waste under 40 CFR Part 761.61. Asbestos abatement was required and completed, and halon fire suppression systems were removed from the building.

Oil Spill Remediation Oversight, Residential Oil Spill, Andover Companies, Avon, CT, 2018 – Mr. Insall is representing the Andover Companies, a third-party insurer, as a technical oversight representative on a residential oil spill in Avon, Connecticut. The goal of the project is to represent the client's interests and ensure that oil remediation by the responsible party is performed in a manner that minimizes future third party liability for the client. Portions of the oil spill have migrated off-site on to State of Connecticut land and off-site residential dwellings. Mr. Insall performs overall technical oversight, remediation plan and specification review, and negotiation with the State of Connecticut Oil & Chemical Spills Division. Mr. Insall also serves as the technical liaison to the responsible party's consultant.

Hazardous Waste Consulting

Hazardous Waste Receiving Chemist, Clean Harbors, Braintree, MA, 1989 to 1990 – Mr. Insall worked extensively in RCRA waste disposal and hazardous waste management for Clean Harbors, Inc. at their Treatment Storage, and Disposal (TSDF) in Braintree, Massachusetts. Mr. Insall was responsible for profiling incoming and outgoing hazardous waste, quality control inspection of waste streams, and resolving disposal problems associated with incoming and outgoing wastes.

U. S. Environmental Protection Agency Contractor, Alternative Remediation Contracts Strategy (ARCS) Program, 1992 to 1995 – Supervised the investigation of approximately 35 hazardous waste (CERCLA) sites under the EPA's ARCS program between 1993 and 1995. Mr. Insall used the Hazard Ranking System (HRS), acted as a liaison between state and Federal regulators, and assisted EPA Region 1 in determining HRS priority rankings for each site.

U. S. Army Corps of Engineers, Site Investigation Prioritization (SIP) Program, 1996 to1997 – Supervised the SIP Program in Connecticut for the U.S. Army Corps of Engineers in conjunction with U.S. EPA Region 1, to investigate hazardous waste and RCRA corrective action sites. Mr. Insall acted as the project manager for Connecticut sites.

RCRA Generator Closure, Yalesville Plating, Wallingford, CT – 2006-2007 – Mr. Insall supervised a RCRA generator closure project at a former-electronics electroplating shop. The closure included waste characterization and removal, an evaluation of the building slab, potential release pathways, and environmental media sampling. While a release was found, Mr. Insall was able to demonstrate that remediation of the release was not necessary, and that the site did not pose a threat to human health and the environment.

RCRA Separation Investigation, Confidential Client, Western PA Site, 2016 – Supervised a complicated investigation to separate RCRA Solid Waste Management Units (SWMUs) and hazardous waste operations for a chemical intermediary manufacturing unit within a larger chemical plant. The manufacturing unit is the sole worldwide manufacturing site for a specific chemical intermediary used by our client. Partner's client signed an agreement to purchase and operate the unit under a land lease. To accomplish this objective, the client required separation of the SWMUs and hazardous waste operations from the larger plant. Partner's task was to determine what actions were necessary to isolate the unit to operate as an autonomous unit, and develop a plan to complete the changes.

Compliance Auditing

Environmental Compliance Services, Okay Industries, Inc., New Britain, CT, 2011 to 2012 – Provided compliance assistance to a manufacturer on several compliance issues. Partner assisted the client with evaluating the design and specification of a belt degreaser to clean manufactured parts, the use of an alternate electroplating rinse water system to reduce wastewater disposal volumes and costs, and the development of a No Exposure Certification for stormwater.

Multimedia Compliance Audit, Amtrak Sunnyside Yard, Queens, NY (Stantec), 2013 – Worked with Amtrak's environmental compliance department, and the personnel at Amtrak's Sunnyside Yard to complete a multi-media compliance audit for the facility. The audit was completed by Mr. Insall over a one-week period. The audit

included RCRA hazardous waste, storm water, materials storage, and fueling operations. The data collected during the audit were used to score the facility using Amtrak's environmental compliance audit scoring system.

Environmental Compliance Audits, Wind River Environmental, Inc., MA and NJ Facilities, 2014 – Supervised the completion of septic residuals and transportation permit compliance audits for a septic residuals operator in the Northeast and Mid-Atlantic States. The audit was performed to review the firm's compliance with operating and collection state regulations. The audit included a review of the company's operations with respect to solid waste, septic residuals, and transportation regulations.

Environmental Compliance Audit, Marlite, Inc., Dover, OH, 2014 to 2015 – Completed a detailed compliance audit for a private equity client purchasing Marlite, Inc. and the real estate owned by the company. The audit included RCRA hazardous waste, the Clean Air Act, EPCRA, the Clean Water Act, materials storage, and stormwater permitting. The audit allowed the purchaser to make changes to plant operations and bring the facility into compliance before the closing.

Environmental Compliance Audit, Arrow Shed, LLC, Haskell, NJ, 2014 –Mr. Insall and Partner's team completed a multi-media compliance audit for a private equity client in preparation for an acquisition of this firm. The audit was completed concurrently with environmental investigation and remediation activities in preparation for an Industrial Site Recovery Act (ISRA) filing in New Jersey. The audit identified several minor compliance deficiencies which were corrected before the acquisition of the firm by our client.

Environmental Compliance Audit, Kline Services, Inc., Salunga, PA, 2014 – Mr. Insall and Partner's team completed a multi-media compliance audit for a private equity client in preparation for an acquisition of this firm. The audit included a review of septic residuals management, transportation, solid waste regulations, the Clean Air Act, the Clean Water Act, and RCRA hazardous waste.

Environmental Compliance Audit, Confidential Manufacturing Facility, Quincy, IL, 2015 to 2016 - Mr. Insall and Partner's team completed an environmental compliance audit for a heavy equipment manufacturing facility in preparation for the sale of the company. The audit identified several compliance deficiencies. As a result of Partner's efforts, the firm was able to bring storm water into compliance by minor modifications to the plant and filing a stormwater No Exposure Certification, saving the company annual stormwater sampling and compliance costs.

Environmental Compliance Audit, Earth Farms, LLC, Various Sites, NC, 2016 – Supervised and acted as the technical lead for a compliance audit of several septic residuals processing plants located in North Carolina. The goal was to ensure that the facilities were in compliance prior to acquisition by a private equity firm, and help the firm operate the facilities in compliance with State and federal regulations in the future.

Industrial Hygiene

Industrial Hygienist, Boston, MA, 1988-1989 – Worked for Covino Environmental Consultants as an industrial hygienist in the Boston area. Mr. Insall was responsible for managing large asbestos abatement projects, performing other industrial hygiene services, and working as a polarized light microscopist. Since that time, Mr. Insall has been engaged to investigate and oversee the remediation/abatement of hazardous building materials at dozens of properties in the Northeastern United States.

Due Diligence

Various Clients, National, 1991-present – Mr. Insall has over 30-years of experience conducting due diligence assessments for clients in the local, regional, and national markets including private equity firms, banks, lenders, developers, law firms, and institutions. The due diligence assessments have included national portfolios, corporate acquisitions, and individual industrial properties throughout the United States. Clients have included Aetna, Bank of America, Cornerstone Real Estate Advisers, Citicorp Real Estate, Fleet Bank, Shawmut Bank, JP Morgan, TD BankNorth, Morgan Stanley, Fairfield County Bank, and other real estate and financial institutions.

Sustainability

Sustainable Redevelopment, South Kent School, Kent, CT, 2013 – Mr. Insall worked with the South Kent School and a noted Master Planner on a feasibility investigation to develop a sustainable farm for the school. The scope of work included an investigation and evaluation of hazardous substance releases at the farm, a conceptual plan to manage farm wastes at a former dairy farm, and an evaluation of down-stream pond eutrophication caused by releases of nitrates from the farm and other sources.

Green Program Development, National REIT, 2007 to 2008 – Mr. Insall was a key planner and designer of a green program for a large commercial and hotel portfolio, with properties located across the United States. With the client, Mr. Insall designed and developed an energy audit protocol to help portfolio properties optimize and reduce energy consumption, increase water and waste recycling, and execute other sustainability initiatives. Data from the portfolio was entered into an interactive software tool designed to allow the owner to manage various energy and utility issues across the portfolio. The project was completed in 2008. One of the key goals of the project was not only to create a green real estate portfolio, but to create value by reducing operating expenses. Reductions in operating expenses were then directly translated into increases in Capex rates. This strategy is being used on an ongoing basis to maximize the portfolio value, and has the potential to generate tens of millions of dollars in value over time.

PCBs: To Test Or Not To Test

Why It Pays to Add An Environmental Compliance Audit

How Environmental Liability Affects Private Equity

When Is Cleaning Up a Dry-Cleaner Worth the Risk?

Statement of Environmental Professional

As required by 40 CFR 312.21(d) the report shall include the following statements of the environmental professional(s) responsible for conducting the Phase I Environmental Site Assessment and preparation of the report. (ASTM E 1527-13)

I declare that to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in section 312.10 of 40 CFR 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

John H. Insall, L.E.P.
Senior Project Manager

Appendix B – Firm Qualifications

Founded in 1966, Tetra Tech is a $2.3 billion environmental, engineering, construction and technical services company with more than16,000 employees and 400 offices worldwide. We are proud of our current ranking as the #1 provider of Environmental Consulting services in the United States, according to Engineering News-Record.

Our *assessment*, *remediation* and *compliance* services include four primary areas that focus on environmental liability: site assessment; remedial design and implementation; regulatory compliance; and litigation support. We help clients identify, avoid, prevent and correct conditions that could cause environmental harm or conflict with environmental regulations.

The combination of our assessment and audit, remediation, and litigation support experience is essential to successful environmental problem solving. With this knowledge, we give clients the confidence and tools to address their environmental issues. Tetra Tech's hands-on experience includes:

- Site assessments and environmental compliance audits throughout the country for industrial, commercial, development, government, legal and banking clients;
- Soil gas surveys using state-of-the-art techniques, installation of soil borings and groundwater monitoring wells, and soil, sediment and groundwater sampling and analysis; and
- Remedial action implementation using a range of technologies such as soil venting, vapor extraction, air stripping, air sparging, soil stabilization/solidification, and on-site low temperature thermal extraction.

John Insall, LEP is a Senior Project Manager in Tetra Tech's site assessment, remediation and compliance group in Wethersfield, CT. He holds a B.A. from Clark University and completed MS Coursework at the University of New Haven. John has 30 years of diversified environmental consulting experience with specializations in site development, innovative remediation technologies, polychlorinated biphenyl (PCB) investigation and remediation, PCB building materials, hazardous building material evaluation, litigation support, expert witness testimony, and regulatory compliance auditing.

Ian Cannan, CHMM is a Senior Project Scientist and Certified Hazardous Materials Manager with nearly 15 years' experience in hazardous waste site cleanup/remediation and environmental compliance. He assists with Phase I Initial Site Investigations, Phase II Comprehensive Site Assessments, Phase III Remedial Action Plans, Release Abatement Measures, Immediate Response Actions, Phase IV Remedy Implementation Plans, Response Action Outcome Statements, and Activity and Use Limitations. His compliance experience includes RCRA/DOT Hazardous Waste Management; chemical inventory tracking/review; EPCRA Section 301, 302 303, 311, and 312 surveys and determinations; Air Source Registrations; SPCC Planning; Refrigerant Management; NPDES Construction General Permits and Remediation General Permits; stormwater best management practices; and construction related Stormwater Pollution Prevention Plans. Ian oversees soil treatment applications, O&M of water treatment/remedial technologies, operation of in-situ injection of chemical oxidation technologies, operation of field screening and monitoring instruments, and soil and groundwater sampling. He earned a B.S. in Environmental Science from Clarkson University.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

State and tribal registered storage tank lists

AST: The Aboveground Storage Tank database contains registered ASTs. The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database.

A review of the AST list, as provided by EDR, has revealed that there is 1 AST site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
FLORIDALE FARM Database: AST, Date of Government Version: 09/25/2018 Facility Id: 4-600621	176 MEAD ROAD	E 1/8 - 1/4 (0.200 mi.)	6	15

ADDITIONAL ENVIRONMENTAL RECORDS

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 10/16/2018 has revealed that there are 4 NY Spills sites within approximately 0.125 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
NYS TWY MP 175.3 TRU Date Closed: 1992-08-03 Spill Number: 9203815 Site ID: 220982	NYS TWY MP 175.3 I-9	SSW 0 - 1/8 (0.063 mi.)	1	8
POLE TOP NAT GRID RT Date Closed: 2012-03-06 Spill Number: 1110405 Site ID: 458240	1767 ST HIGHWAY 5S	W 0 - 1/8 (0.064 mi.)	A2	9
SYSCO TRUCK RT 5S Date Closed: 2015-02-18 Spill Number: 1406532 Site ID: 500006	1785 RT 5S	W 0 - 1/8 (0.095 mi.)	A4	13
LIBERTY ENTERPRISES Date Closed: 1987-06-01 Spill Number: 8700862 Site ID: 283702	RT 5S (1467)	E 0 - 1/8 (0.117 mi.)	5	14

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
MONTGOMERY CO - FORM EPA ID:: NYR000092726	***250 HIRSHFIELD RD***	***NNW 0 - 1/8 (0.071 mi.)***	***3***	***10***

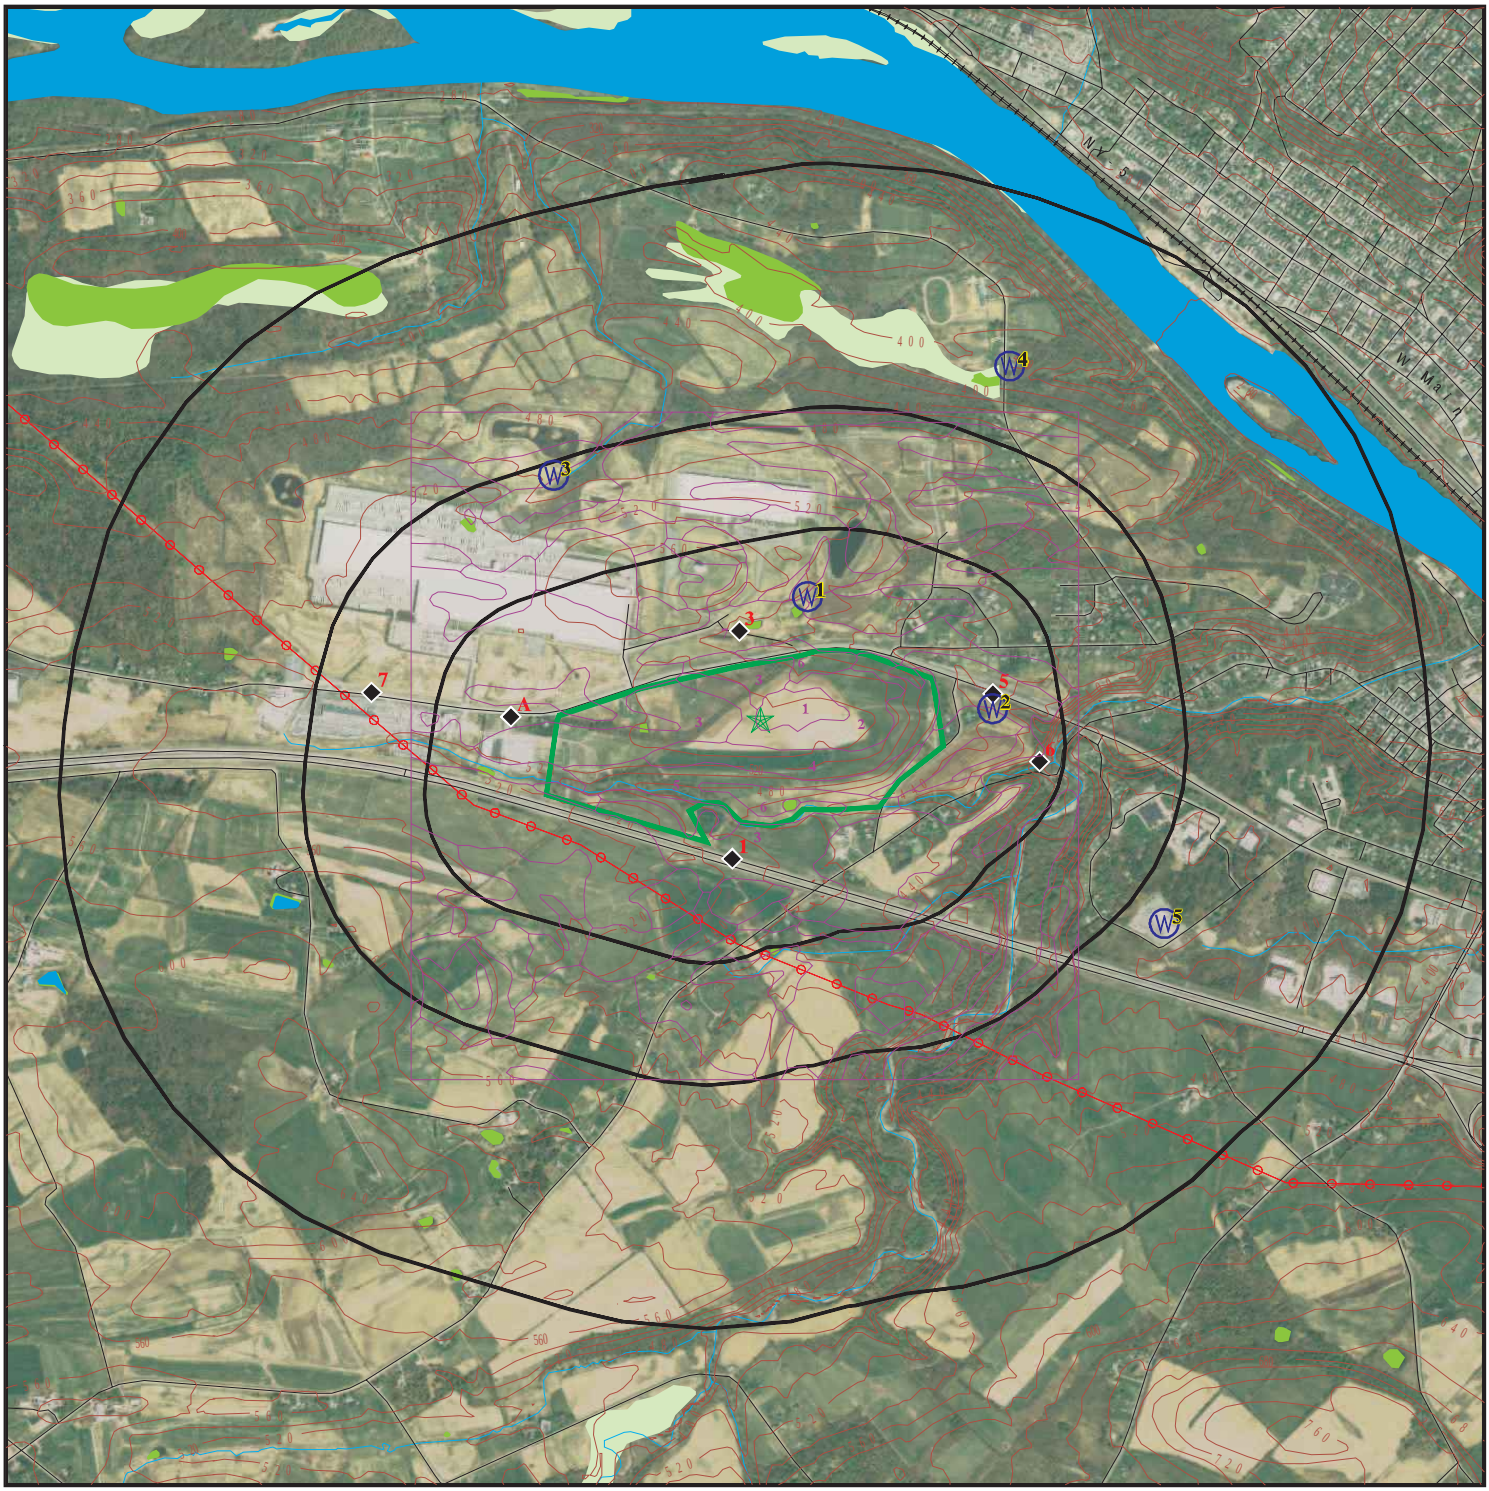
HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there is 1 HSWDS site within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
AMSTERDAM TERMINAL	RT. 5S	W 1/4 - 1/2 (0.385 mi.)	7	18

MANIFEST: Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a TSD facility.

A review of the MANIFEST list, as provided by EDR, and dated 07/01/2018 has revealed that there is 1 MANIFEST site within approximately 0.25 miles of the target property.



Lower Elevation	Address	Direction / Distance	Map ID	Page
MONTGOMERY CO - FORM EPA ID: NYR000092726	***250 HIRSHFIELD RD***	***NNW 0 - 1/8 (0.071 mi.)***	***3***	***10***

EXECUTIVE SUMMARY

Due to poor or inadequate address information, the following sites were not mapped. Count: 1 records.

DEC Memo:	"11/23/11 - Large 15 kva box transformer located outside abandoned warehouse building on south side of Rt 5S. Property recently purchased and being renovated. NG planned to re-energize transformer, upon inspection found it to be leaking non-PCB oil to the ground following underground conduits. Removed transformer, will be installing new today or Friday. EPS called to clean up. Vac truck on site to dewater excavation that resulted from the removal of the transformer and foundation. EPS then removed approximately 5 yards of impacted soil and stockpiled/covered on the property for later disposal. Remaining excavation filled with water, no sheen noticed this morning. No further action anticipated other than disposal of stockpiled soil. Area now served with muni water and sanitary sewer. BB 3/6/12 - Disposal complete, closed. BB"
Remarks:	"soil and roadway/unknown if PCB, clean up underway"

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Violation Status: No violations found

FINDS:

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 07/17/2018

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State and tribal institutional control / engineering control registries

ENV RES DECL: Environmental Restrictive Declarations

The Environmental Restrictive Declarations (ERD) listed were recorded in connection with a zoning action against the noted Tax Blocks and Tax Lots, or portion thereof, and are available in the property records on file at the Office of the City Register for Bronx, Kings, New York and Queens counties or at the Richmond County Clerk's office. They contain environmental requirements with respect to hazardous materials, air quality and/or noise in accordance with Section 11-15 of this Resolution.

RES DECL: Restrictive Declarations Listing

A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

State and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing
In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

E DESIGNATION: E DESIGNATION SITE LISTING
The (E (Environmental)) designation would ensure that sampling and remediation take place on the subject properties, and would avoid any significant impacts related to hazardous materials at these locations. The (E) designations would require that the fee owner of the sites conduct a testing and sampling protocol, and remediation where appropriate, to the satisfaction of the NYCDEP before the issuance of a building permit by the Department of Buildings pursuant to the provisions of Section 11-15 of the Zoning Resolution (Environmental Requirements). The (E) designations also include a mandatory construction-related health and safety plan which must be approved by NYCDEP.

Last EDR Contact: 09/10/2018
Next Scheduled EDR Contact: 12/24/2018
Data Release Frequency: Varies

HSWDS: Hazardous Substance Waste Disposal Site Inventory
The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

SPDES: State Pollutant Discharge Elimination System

New York State has a state program which has been approved by the United States Environmental Protection Agency for the control of wastewater and stormwater discharges in accordance with the Clean Water Act. Under New York State law the program is known as the State Pollutant Discharge Elimination System (SPDES) and is broader in scope than that required by the Clean Water Act in that it controls point source discharges to groundwaters as well as surface waters.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 08/10/2018
Date Data Arrived at EDR: 08/10/2018

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

West Map:	5939533 TRIBES HILL, NY
Version Date:	2013

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

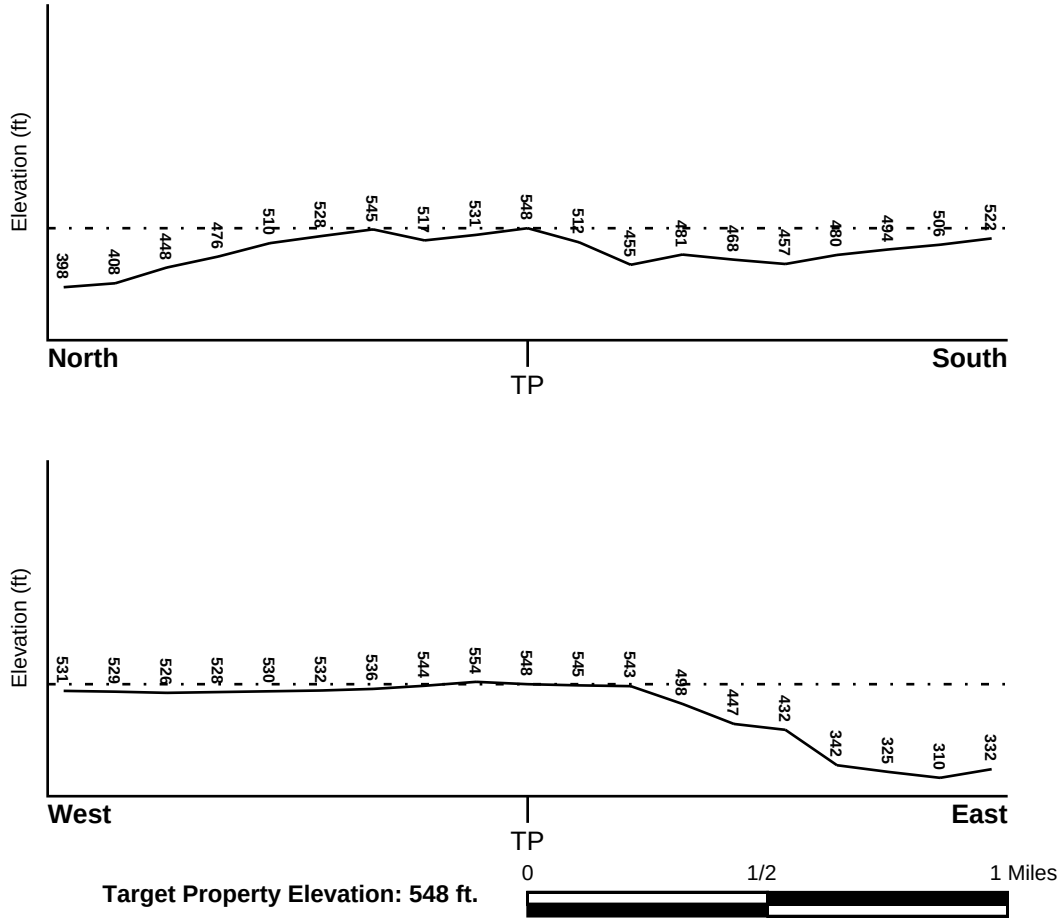
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
Not Reported	

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
AMSTERDAM	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

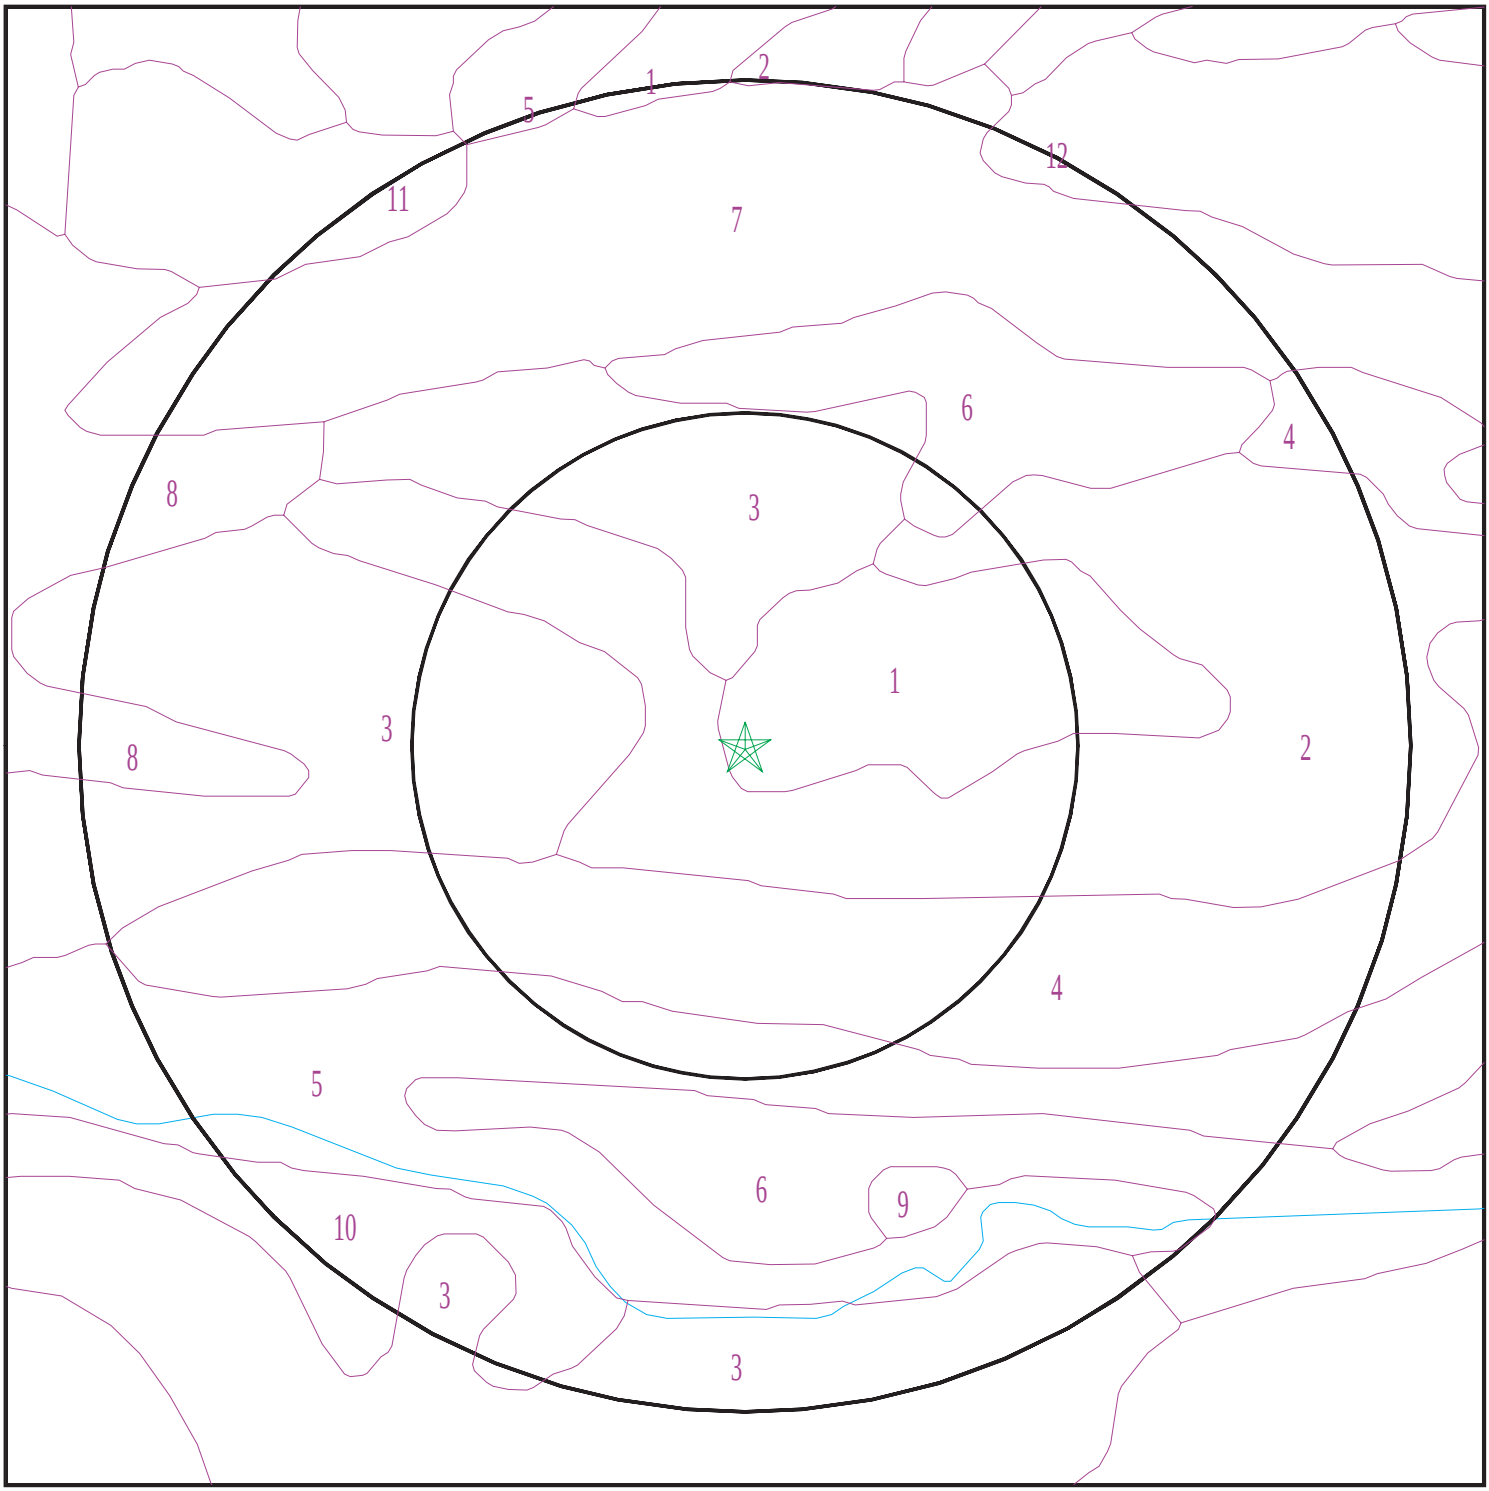
GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT



Era:	Paleozoic
System:	Ordovician
Series:	Middle Ordovician (Mohawkian)
Code:	O2 *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Angola

Soil Surface Texture: silt loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 31 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	silt loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
2	9 inches	24 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
3	24 inches	27 inches	weathered bedrock	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Map ID: 2

Soil Component Name: Palatine

Soil Surface Texture: silt loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Re: Written Request for Public Records Review
10 Parcels in Town of Florida, NY

Dear Sir or Madam:

Under the New York Freedom of Information Law, we are requesting an opportunity to obtain copies of public records. Please find enclosed the written request for public records on the form required by Montgomery County. This request relates to review of the following properties located in Montgomery County New York:

Site Address	Assessor Designation
St. Hwy 5S Florida, NY 12010	54.-1-35-161
St. Hwy 5S Florida, NY 12010	54.-1-37
St. Hwy 5S Florida, NY 12010	54.-1-35.121
St. Hwy 5S Florida, NY 12010	54.-1-35.141
St. Hwy 5S Florida, NY 12010	54.-1-36
St. Hwy 5S Florida, NY 12010	54.-1-35.11
1733 St. Hwy 5S Florida, NY 12010	54.-1-35-151
1711 St. Hwy 5S Florida, NY 12010	54.-1-35.131
176 Mead Rd. Florida, NY 12010	55.-1-1.1
St. Hwy 5S Florida, NY 12010	55.-2-4.1

1200 Scottsville Rd., Building C, Suite 320
Rochester, NY 14624
Tel 845.695.0279 tetratech.com

This inquiry is part of a ASTM Phase I Environmental Site Assessment, and we are requesting information or records pertaining to the following local/county records:

- Releases of oil and/or hazardous substances;
- Permits, approvals or licenses for the storage of oil and/or hazardous substances;
- Lists of brownfields;
- Lists of landfills or solid waste disposal;
- List of hazardous waste or contaminated sites;
- List of registered/permitted storage tanks;
- Records of activity and use limitations;
- Records of emergency release reports; and/or
- Records of contaminated drinking water wells.

If there are any fees for copying these records, please inform me of the cost. Please contact the undersigned at 845-695-0249 or ian.cannan@tetratech.com if you have any questions or require additional information regarding this request.

Very truly yours,

Ian S. Cannan, CHMM
Sr. Project Scientist

Questionnaires

INTERVIEW NOTES

Date/Time:	November 5, 2016	**Tetra Tech Contact:**	Ian Cannan
Contact:	Ernie Daviero	**Ref. No.:**	143-254457-19002
Property:	1711 St. Hwy 5S Amsterdam, NY 12010 54.-1-35.131	**Subject:**	ASTM E1527-13

Ian Cannan visited the referenced property and interviewed Mr. Ernie Daviero regarding his knowledge of Recognized Environmental Conditions (RECs) in connection with his property. Mr. Daviero did not have affirmative answers to the questions required per ASTM E1527-13 regarding knowledge of RECs with the exception of the following:

- The furnace for the property is fueled by heating oil which is stored in an aboveground storage tank located in the basement of the residence.

- Wastewater from the property is discharged to an on-site septic system located in the front (toward State Highway 5S) of the property. The septic system was pumped out earlier this year (2018).

INTERVIEW NOTES

Date/Time:	November 5, 2016	**Tetra Tech Contact:**	Ian Cannan
Contact:	John Fraiser	**Ref. No.:**	143-254457-19002
Property:	1733 St. Hwy 5S Amsterdam, NY 12010 54.-1-35.151	**Subject:**	ASTM E1527-13

Ian Cannan visited the referenced property and interviewed Mr. John Fraiser regarding his knowledge of Recognized Environmental Conditions (RECs) in connection with his property. Mr. Fraiser did not have affirmative answers to the questions required per ASTM E1527-13 regarding knowledge of RECs with the exception of the following:

- The furnace for the property was fueled by heating oil in the past which was stored in an aboveground storage tank (AST) located in the basement of the residence. The heating oil AST remains in the basement but has been disconnected from the furnace. Oil was last used for heating at the residence about 2 or 3 years ago, when the system was converted to propane. Propane is no longer used for heating purposes, and the former propane AST was removed. Mr. Fraiser indicated that there are some oil stains under the AST from unavoidable drips during past oil filter replacements. Mr. Fraiser indicated he has tried cleaning the stained surface, but some staining remains.

- Wastewater from the property is currently discharge to the municipal sewer system. However, in the past wastewater was discharged to an on-site septic system located in the back (away from State Highway 5S) of the property. The septic system has not been used since the late 1990s or early 2000s.

ASTM E1527-13 Sections 6, 10.8 and 10.9: Information Provided by User

SITE ADDRESS:

10 Parcels in Town of Florida, NY

PROJECT NO:

143-254457-19002

"User's Responsibilities. The purpose of this section is to describe tasks to be performed by the user. The "All Appropriate Inquiries" Final Rule (40 CFR Part 312) requires that these tasks be performed by or on behalf of a party seeking to qualify for an LLP to CERCLA liability. These tasks must also be completed by or on behalf of EPA Brownfield Assessment and Characterization grantees. While such information is not required to be provided to the environmental professional, the environmental professional shall request that the user provide the results of these tasks as such information can assist the environmental professional in identifying recognized environmental conditions." ASTM E1527-13

	Yes	No
Are you aware of any commonly known information within the local community related to environmental conditions at the property? For example,	☐	☒
Do you know of specific chemicals that are present or once were present at the property?	☐	☒
Do you know of spills or other chemical releases that have taken place at the property?	☐	☒
Do you know the past uses of the property?	☒	☐
Do you know of any environmental cleanups that have taken place at the property?	☐	☒
Have you checked, or engaged a title company or title professional to check reasonably ascertainable recorded land title records, lien records and judicial records for environmental liens or activity and use limitations currently recorded against the property?	☐	☒
Do you know of any environmental cleanup liens or activity and use limitations currently or formerly recorded against the property? For example, AULs such as engineering controls, land use restrictions or institutional controls that are in place at the Site?	☐	☒
Do you have any specialized knowledge or experience that is material to recognized environmental conditions in connection with the property? For example, do you have specialized knowledge of the chemicals and processes used by this type of business?	☐	☒
If this is a transaction involving the purchase of a parcel of commercial real estate, do you have actual knowledge that the purchase price of the property is significantly less than the purchase price of comparable properties? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property? If yes, identify an explanation for the lower price and provide a written record of such explanation.	☐	☒
Based on your knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of contamination at the property?	☐	☒

What is the purpose for the environmental site assessment?

Purchase of property ☐ Refinancing of property ☐ Sale of property X☐X

Other_____

(If the User does not identify the purpose of the study, the ASTM standard assumes that the purpose of the study is to qualify for landowner liability protection under CERCLA.)

Marlborough, MA 01752
Contact: Ian Cannan

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech Rizzo were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

PO # NA

Project 143-254457-19002

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 37C9-4CBA-AD9D

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Tetra Tech Rizzo (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

APPENDIX B FIELD NOTES

EXECUTIVE SUMMARY

Tetra Tech has completed a Phase II Environmental Site Assessment (ESA) of the State Highway 5S and Mead Road parcels located in Florida, New York 12010 (the Site)(Figure 1). The Site is comprised of ten individual parcels of land located in the Town of Florida, New York. Three of the parcels (Assessor Parcels 54.-1-35-11, -121, and -161) are undeveloped vacant rural land. Assessor Parcel 54.-1-36 is undeveloped vacant industrial land. Two parcels are single family residences (Assessor Parcels 54.-1-35-131 and -151). An active dairy farm is located at Assessor Parcel 55.-1-1.1. Assessor Parcels 54.-1-37 and 55.-2-4.1 are currently used for the cultivation of crops. Finally, Assessor Parcel 54.-1-35.141 is a vacant former farm stand or garden center (Figure 2).

Background

Tetra Tech completed a Phase I Environmental Site Assessment (ESA) at the Site in accordance with the American Society for Testing and Material (ASTM) standard for Phase I ESAs E1527-13 on April 1, 2019. The Site history was established back to approximately 1890, when a residence was constructed at 176 Mead Road (Assessor Parcel 55-1-1.1). The Site and surrounding lands were likely associated with agricultural or similar low intensity use from the late 1800s to the late 1980s. In the late 1980s and early 1990s residences were constructed at 1733 and 1711 State Highway 5S. Subsequently a farm stand was established Assessor Parcel 54.-1-35.141 in approximately 1999 and was active for a few years and is believed to have ceased operations in the mid-2000s. In the late 1990s or early 2000s municipal water and sewerage were made available during development of the surrounding area for commercial use. The Site is not identified in environmental database records. Several off-site properties are identified in environmental databases and include state spill sites, and New York State Department of Environmental Conservation (NYSDEC) Petroleum Bulk Storage (PBS) sites. Based on their distance and direction, the off-site properties are unlikely to impact soil or groundwater at the Site.

Tetra Tech did not identify Recognized Environmental Conditions (RECs), Historical Recognized Conditions (HRECs), or Controlled Recognized Environmental Conditions (CRECs) associated with the Site as defined by the ASTM standard. One de minimis condition and one environmental issue were identified during the Phase I ESA and discussed below.

The property identified as Assessor Parcel 54.-1-35-151 (1733 State Highway 5S) also has a 250-gallon home heating oil AST in the basement of the residence. The AST was observed to be in average condition and no visible defects or active leaks of oil were observed. The heating oil AST was not connected to the furnace and the connection point was capped at the bottom of the AST. During an interview with Mr. John Frasier (the site contact/owner), Mr. Frasier indicated that the heating oil AST contains some residual oil, and at the time of the Site visit the tank was observed to be less than ¼ full. Also, during the Site reconnaissance visible oil staining was observed upon the concrete surface at the bottom of the AST. There were no strong or pungent odors from the staining and no evidence that a release had occurred from the tank. Also, the concrete floor in the area of the stain did not display evidence of obvious cracks or conveyances to the subsurface. During the interview, Mr. Frasier indicated that the staining was attributable to minor drips during replacement of the oil filter at the bottom of the AST. This AST is not considered a REC or historical REC, based on the available information and observations. The presence of the unused former AST with residual stored oil and residual oil staining of the concrete surface is considered a *de minimis* condition.

A small accumulation of used tires was observed at Assessor Parcel 55.-2-4.1 at the central-eastern boundary of the property. The accumulation did not suggest the on-site disposal of solid waste or dumping. The small accumulation of tires was consistent with practices that are typical of this type of rural property. The accumulation of tires is not considered a REC, historical REC, or *de minimis* condition but was identified as an environmental issue.

Based on the findings of the Phase I ESA, Tetra Tech recommended that the unused AST at 1733 State Highway 5S be decommissioned and removed from the property and that the accumulated pile of used tires (solid waste) be removed from Assessor Parcel 55.-2-4.1.

Phase II ESA Scope of Work

Since the Client (WE Acquisitions LLC) intends to redevelop the Site, the Client requested that Tetra Tech conduct a Phase II ESA at the Site to evaluate the environmental condition of soils and confirm that hazardous substance releases have not occurred. The scope of the Phase II ESA included soil sampling and laboratory analysis of soils collected from 18 soil boring advanced at the Site (Figure 3). The soil borings were advanced to a depth of 6 feet below grade (fbg) at each location. Soils at each boring location were field screened for evidence of contamination. One selected soil sample from each location was then submitted for laboratory analysis. Soil samples were analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8260, Polyaromatic Hydrocarbons (PAHs) by EPA Method 8270D, pesticides by EPA Method 8081B, herbicides by EPA Method 8151A, and total 8 Resource Conservation and Recovery Act (RCRA) Metals by EPA Method 6010D. The samples were analyzed by Contest Analytical Laboratories, Inc. of East Longmeadow, Massachusetts.

Soil Sampling and Analytical Results

No soil staining, odors or positive photoionization detector (PID) field screening results were recorded. The soils at each boring location appeared to be consistent with natural soils. VOCs, PAHs, pesticides and herbicides were not detected in the soil samples. Very low levels of toluene were detected in soil sample TT-SB-14 (0.0068 mg/kg) and the duplicate sample collected at TT-SB-13 (0.0028 mg/kg)(but not parent sample TT-SB-13) and below the cleanup standard (0.7 mg/kg). These samples were collected from an open agricultural field and no source of toluene (such as stormwater runoff) exists in this area. Since toluene was not detected in parent sample TT-SB-13, Tetra Tech determined that the detection is a laboratory induced artifact rather than a constituent in soil (i.e. a false positive).

Low levels of metals were detected in the soil samples at concentrations that are consistent with the background values for metals published in the *Concentrations of Selected Analytes in Rural New York State Surface Soils: A Summary Report on the Statewide Rural Surface Soil Survey* publication dated August 2005 published by NYSDEC and the New York State Department of Health (NYSDOH).

The analytical results indicate that the soils are in compliance with the Unrestricted Use Soil Cleanup Objectives published in 6 NYCRR Part 375 (Environmental Remediation Programs)(Subparts 375-1 to 375-4 & 375-6 dated December 14, 2006) and/or NYSDEC publication CP-51 (Soil Cleanup Guidance dated October 21, 2010. Laboratory analytical data reports are included in Appendix A. Field notes are included as Appendix B. Analytical results are presented in Table 1.

Conclusions

Based on the analytical results, a release of hazardous substances has not occurred at the Site. Soil site-wide may be used at the Site or exported off-site in an unrestricted manner as clean fill. Based on the Phase II ESA results, no further environmental investigation is recommended.

1.0 INTRODUCTION

1.1 INTRODUCTION

Tetra Tech has completed a Phase II Environmental Site Assessment (ESA) of the State Highway 5S and Mead Road Parcels located in Florida, New York 12010 (the Site)(Figure 1). A summary of the investigation and the soil sampling results are presented herein.

1.2 USER RELIANCE

This study and report have been prepared on behalf of and for the exclusive use of WE Acquisitions LLC solely for use in an environmental evaluation of the Site. This report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other party, nor used by any other party in whole or in part, without the prior written consent of Tetra Tech. However, Tetra Tech acknowledges and agrees that, subject to the Terms and Conditions of our contract dated March 11, 2019, the report may be conveyed to the client's attorney, lender, insurer, title insurer, regulatory agencies, and potential purchasers associated with the proximate purchase or refinancing of the Site by our client. Tetra Tech would be pleased to discuss the conditions of dissemination of the report to additional parties associated with the transaction. The report has been prepared in accordance with the Terms and Conditions set forth in our contract dated March 11, 2019. All uses of this report are subject to, and deemed acceptance of, the conditions and restrictions contained therein. No other warranty, express or implied, is made.

2.0 BACKGROUND

This section provides a brief description of the Site and the results of a Phase I Environmental Site Assessment (ESA) prepared by Tetra Tech in accordance with the American Society for Testing and Material (ASTM) standard for Phase I ESAs E1527-13 on April 1, 2019.

2.1 SITE DESCRIPTION

The Site is comprised of ten individual parcels of land located in the Town of Florida, New York (Figure 1). Three of the parcels (Assessor Parcels 54.-1-35-11, -121, and -161) are undeveloped vacant rural land. Assessor Parcel 54.-1-36 is undeveloped vacant industrial land. Two parcels are single family residences (Assessor Parcels 54.-1-35-131 and -151). An active dairy farm is located at Assessor Parcel 55.-1-1.1. Assessor Parcels 54.-1-37 and 55.-2-4.1 are currently used for the cultivation of crops. Finally, Assessor Parcel 54.-1-35.141 is a vacant former farm stand or garden center (Figure 2).

2.2 SITE HISTORY

The Site history was established back to approximately 1890, when a residence was constructed at 176 Mead Road (Assessor Parcel 55-1-1.1). The Site and surrounding lands were likely associated with agricultural or similar low intensity use from the late 1800s to the late 1980s. In the late 1980s and early 1990s residences were constructed at 1733 and 1711 State Highway 5S. Subsequently a farm stand was established Assessor Parcel 54.-1-35.141 in approximately 1999 and was active for a few years and is believed to have ceased operations in the mid-2000s. In the late 1990s or early 2000s municipal water and sewerage were made available during development of the surrounding area for commercial use. The Site is not identified in environmental database records. Several off-site properties are identified in environmental databases and include state spill sites, and New York State Department of Environmental Conservation (NYSDEC) Petroleum Bulk Storage (PBS) sites. Based on their distance and direction, the off-site properties are unlikely to impact soil or groundwater at the Site.

2.3 PHASE I ESA FINDINGS AND CONCLUSIONS

the west. Tetra Tech did not identify Recognized Environmental Conditions (RECs), Historical Recognized Conditions (HRECs), or Controlled Recognized Environmental Conditions (CRECs) associated with the Site as defined by the ASTM standard. One de minimis condition and one environmental issue were identified during the Phase I ESA and discussed below.

The property identified as Assessor Parcel 54.-1-35-151 (1733 State Highway 5S) also has a 250-gallon home heating oil AST in the basement of the residence. The AST was observed to be in average condition and no visible defects or active leaks of oil were observed. The heating oil AST was not connected to the furnace and the connection point was capped at the bottom of the AST. During an interview with Mr. John Frasier (the site contact/owner), Mr. Frasier indicated that the heating oil AST contains some residual oil, and at the time of the Site visit the tank was observed to be less than ¼ full. Also, during the Site reconnaissance visible oil staining was observed upon the concrete surface at the bottom of the AST. There were no strong or pungent odors from the staining and no evidence that a release had occurred from

the tank. Also, the concrete floor in the area of the stain did not display evidence of obvious cracks or conveyances to the subsurface. During the interview, Mr. Frasier indicated that the staining was attributable to minor drips during replacement of the oil filter at the bottom of the AST. This AST is not considered a REC or historical REC, based on the available information and observations. The presence of the unused former AST with residual stored oil and residual oil staining of the concrete surface is considered a *de minimis* condition.

A small accumulation of used tires was observed at Assessor Parcel 55.-2-4.1 at the central-eastern boundary of the property. The accumulation did not suggest the on-site disposal of solid waste or dumping. The small accumulation of tires was consistent with practices that are typical of this type of rural property. The accumulation of tires is not considered a REC, historical REC, or *de minimis* condition but was identified as an environmental issue.

Based on the findings of the Phase I ESA, Tetra Tech recommended that the unused AST at 1733 State Highway 5S be decommissioned and removed from the property and that the accumulated pile of used tires (solid waste) be removed from Assessor Parcel 55.-2-4.1.

3.0 PHASE II SCOPE OF WORK

3.1 SCOPE OF WORK

Since the Client (WE Acquisitions LLC) intends to redevelop the Site, the Client requested that Tetra Tech conduct a Phase II ESA at the Site to evaluate the environmental condition of soils and confirm that hazardous substance releases have not occurred. The scope of the Phase II ESA included soil sampling and laboratory analysis of soils collected from 18 soil boring advanced at the Site (Figure 3). The soil borings were advanced to a depth of 6 feet below grade (fbg) at each location. Soils at each boring location were field screened for evidence of contamination. One selected soil sample from each location was then submitted for laboratory analysis. Soil samples were analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8260, Polyaromatic Hydrocarbons (PAHs) by EPA Method 8270D, pesticides by EPA Method 8081B, herbicides by EPA Method 8151A, and total 8 Resource Conservation and Recovery Act (RCRA) Metals by EPA Method 6010D. The samples were analyzed by Contest Analytical Laboratories, Inc. of East Longmeadow, Massachusetts

3.2 SOIL BORING AND SAMPLING

Tetra Tech performed soil boring and sampling at the Site on March 25 and 29, 2019. Prior to sampling, Tetra Tech contacted the public utility clearance service and obtained utility clearance for the work. The soil boring and sampling were performed by Cascades Technical Services, LLC (Cascades) using a Geoprobe 7822DT direct push rig. Mr. Joseph Hutchins and Mr. Richard Reagan of Cascades operated the Geoprobe.

3.3 FIELD SCREENING RESULTS

Mr. Ian Canaan of Tetra Tech supervised the soil sampling, conducted field screening and selected soil samples for laboratory analysis. Soil at the Site consists of topsoil trending to brown to gray silty clay and clay with some sand and gravel. Traces of shale (apparent bedrock) were encountered from 4 to 6 fbg in some locations). No soil staining, odors or positive photoionization detector (PID) field screening results were recorded. The soils at each boring location appeared to be consistent with natural soils. Mr. Ian Canaan of Tetra Tech supervised the soil boring activities, screened soils, and collected samples for laboratory analysis.

3.4 ANALYTICAL RESULTS

VOCs, PAHs, pesticides and herbicides were not detected in the soil samples. Very low levels of toluene were detected in soil sample TT-SB-14 (0.0068 mg/kg) and the duplicate sample collected at TT-SB-13 (0.0028 mg/kg)(but not parent sample TT-SB-13) and below the cleanup standard (0.7 mg/kg). These samples were collected from an open agricultural field and no source of toluene (such as stormwater runoff) exists in this area. Since toluene was not detected in parent sample TT-SB-13, Tetra Tech determined that the detection is a laboratory induced artifact rather than a constituent in soil (i.e. a false positive).

Low levels of metals were detected in the soil samples at concentrations that are consistent with the background values for metals published in the *Concentrations of Selected Analytes in Rural New York State Surface Soils: A Summary Report on the Statewide Rural Surface Soil Survey* publication dated August 2005 published by NYSDEC and the New York State Department of Health (NYSDOH).

The analytical results indicate that the soils are in compliance with the Unrestricted Use Soil Cleanup Objectives published in 6 NYCRR Part 375 (Environmental Remediation Programs)(Subparts 375-1 to 375-4 & 375-6 dated December 14, 2006) and/or NYSDEC publication CP-51 (Soil Cleanup Guidance dated October 21, 2010. Laboratory analytical data reports are included in Appendix A. Field notes are included as Appendix B. Analytical results are presented in Table 1.

4.0 DATA QUALITY REVIEW

4.1 DATA QUALITY OBJECTIVES

Data quality objectives established for the Phase II ESA include the following:

1. The data must be adequate to detect the constituents of concern most typically associated with hazardous substance releases at agricultural properties.
2. The data must be analyzed following established analytical procedures.
3. The laboratory must be licensed by the State of New York.
4. The data must be reproducible, accurate and precise.
5. Analytical detection limits must be below the Unrestricted Use Soil Cleanup Objectives published in 6 NYCRR Part 375 and/or NYSDEC publication CP-51.

Based on our review of the laboratory reports, the data quality objectives were met.

4.2 ANALYTICAL DETECTION LIMITS

Analytical detection limits were below the cleanup standards for most compounds. However, the minimum laboratory detection limits were slightly above the cleanup standards for a few compounds such as aldrin, 4,4-DDT, 4,4-DDD, and 4,4-DDE because the standards for some of these compounds are below the minimum analytical limits that the lab can attain. Based on the absence of pesticide detection in all samples, Tetra Tech did not identify this as a significant data quality limitation.

4.3 LAB QUALITY CONTROL AND DATA LIMITATIONS

Based on Tetra Tech's review of the laboratory data, no significant quality issues or data quality limitations were identified (Appendix A. As a result, the data were deemed to be suitable and reliable for use in determining if hazardous substance releases have occurred.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the analytical results, a release of hazardous substances has not occurred at the Site. Soil site-wide may be used at the Site or exported off-site in an unrestricted manner as clean fill. Based on the Phase II ESA results, no further environmental investigation is recommended.

6.0 SIGNATURES

Tetra Tech appreciates the opportunity to work with WE Acquisitions LLC on this project. If you have any questions concerning the findings or conclusions contained in this report, please contact John Insall, LEP at (860) 571-8011.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 8151, samples were derivatized on 03/30/19.

For method 8151, sample analysis bracketed by LCS to monitor esterification. All recoveries in the bracketing LCS met method criteria.

For method 8270, only PAHs were requested and reported.

39 Spruce Street * East Longmeadow, MA 01028 * FAX 413/525-6405 * TEL. 413/525-2332

SW-846 8151A

Qualifications:

S-12

Surrogate recovery is outside of control limits on confirmatory column, but within control limits on primary column. Data validation is not affected.

Analyte & Samples(s) Qualified:

2,4-Dichlorophenylacetic acid [2C]

19C1374-10[TT-SB-10 (0-2)]

SW-846 8260C

Qualifications:

L-04

Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.

Analyte & Samples(s) Qualified:

Chloromethane

19C1374-01[TT-SB-01 (2-4)], 19C1374-02[TT-SB-02 (2-4)], 19C1374-03[TT-SB-03 (4-6)], 19C1374-04[TT-SB-04 (4-6)], 19C1374-05[TT-SB-05 (1.3-4)], 19C1374-06[TT-SB-06 (0-1.8)], 19C1374-07[TT-SB-07 (2-4)], 19C1374-08[TT-SB-08 (4-6)], 19C1374-09[TT-SB-09 (4-6)], 19C1374-10[TT-SB-10 (0-2)], 19C1374-11[TT-SB-11 (4-6)], 19C1374-12[TT-SB-12 (0-2)], B226979-BLK1, B226979-BS1, B226979-BSD1

L-07

Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.

Analyte & Samples(s) Qualified:

Trichlorofluoromethane (Freon 11)

B226979-BSD1

R-05

Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.

Analyte & Samples(s) Qualified:

Acetone

19C1374-01[TT-SB-01 (2-4)], 19C1374-02[TT-SB-02 (2-4)], 19C1374-03[TT-SB-03 (4-6)], 19C1374-04[TT-SB-04 (4-6)], 19C1374-05[TT-SB-05 (1.3-4)], 19C1374-06[TT-SB-06 (0-1.8)], 19C1374-07[TT-SB-07 (2-4)], 19C1374-08[TT-SB-08 (4-6)], 19C1374-09[TT-SB-09 (4-6)], 19C1374-10[TT-SB-10 (0-2)], 19C1374-11[TT-SB-11 (4-6)], 19C1374-12[TT-SB-12 (0-2)], B226979-BLK1, B226979-BS1, B226979-BSD1

V-20

Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

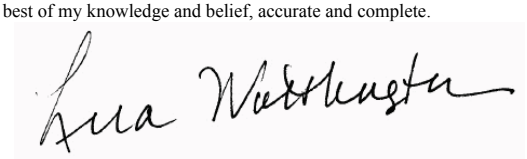
Analyte & Samples(s) Qualified:

Bromoform

B226979-BS1, B226979-BSD1, S034134-CCV1

V-34

Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.



Analyte & Samples(s) Qualified:

Bromomethane

19C1374-01[TT-SB-01 (2-4)], 19C1374-02[TT-SB-02 (2-4)], 19C1374-03[TT-SB-03 (4-6)], 19C1374-04[TT-SB-04 (4-6)], 19C1374-05[TT-SB-05 (1.3-4)], 19C1374-06[TT-SB-06 (0-1.8)], 19C1374-07[TT-SB-07 (2-4)], 19C1374-08[TT-SB-08 (4-6)], 19C1374-09[TT-SB-09 (4-6)], 19C1374-10[TT-SB-10 (0-2)], 19C1374-11[TT-SB-11 (4-6)], 19C1374-12[TT-SB-12 (0-2)], B226979-BLK1, B226979-BS1, B226979-BSD1, S034134-CCV1

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.

L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
R-05	Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.
S-12	Surrogate recovery is outside of control limits on confirmatory column, but within control limits on primary column. Data validation is not affected.
V-20	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
V-34	Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 8151, samples were derivatized on 04/02/19 .

For method 8151, sample analysis bracketed by LCS to monitor esterification. All recoveries in the bracketing LCS met method criteria.
For method 8270, only PAHs were requested and reported.

SW-846 8081B

Qualifications:

R-06

Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.

Analyte & Samples(s) Qualified:

alpha-BHC
19C1653-03[TT-SB-13 (0-2)], B227439-MS1, B227439-MSD1

alpha-BHC [2C]
19C1653-03[TT-SB-13 (0-2)], B227439-MS1, B227439-MSD1

gamma-BHC (Lindane)
19C1653-03[TT-SB-13 (0-2)], B227439-MS1, B227439-MSD1

SW-846 8260C

Qualifications:

L-07

Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.

Analyte & Samples(s) Qualified:

Acetone
B227219-BS1

V-20

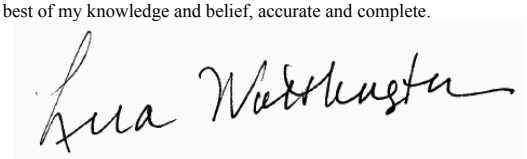
Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:

1,2-Dibromo-3-chloropropane (DB
B227219-BS1, B227219-BSD1, S034250-CCV1

Bromoform
B227219-BS1, B227219-BSD1, S034250-CCV1

V-34



Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Analyte & Samples(s) Qualified:

Bromomethane
19C1653-01[TB-1], 19C1653-02[DUP-1], 19C1653-03[TT-SB-13 (0-2)], 19C1653-04[TT-SB-14 (0-2)], 19C1653-05[TT-SB-15 (2-4)], 19C1653-06[TT-SB-16 (0-2)], 19C1653-07[TT-SB-17 (2-4)], 19C1653-08[TT-SB-18 (0-2)], B227219-BLK1, B227219-BS1, B227219-BSD1, S034250-CCV1

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.
I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Lisa A. Worthington
Technical Representative

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
R-06	Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.
V-20	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
V-34	Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Terracon Project No. J1187144

Dear Mr. Chan:

Terracon Consultants, Inc. (Terracon) is pleased to submit the attached report for the above-referenced project to WE Acqusitions, LLC. The purpose of this report is to present the results of the hazardous materials survey performed at the Five Residential-Type Structures on November 20, 2018 and January 14, 2019 at 1711 and 1733 5S Highway Amsterdam/Florida, New York . The survey was conducted in general accordance with Terracon proposal PJ1187144, dated October 12, 2018.

Terracon appreciates the opportunity to provide this service to WE Acqusitions, LLC. If you have any questions regarding this report please contact the undersigned at 603-647-9700.

Sincerely,
Terracon Consultants, Inc.

Jim Lovell
Senior Staff Industrial Hygienist

HAZARDOUS MATERIALS SURVEY REPORT
Five Residential-Type Structures
1711 and 1733 5S Highway
Amsterdam/Florida, New York 12010

Terracon Project No. J1187144
January 28, 2019

1.0 INTRODUCTION

Terracon conducted a hazardous materials survey of Five Residential-Type Structures at 1711 and 1733 5S Highway (Site) located at Florida/Amsterdam, New York. The hazardous materials survey included and asbestos survey, limited sampling for lead-containing paint (LCP), and observations for other potentially hazardous materials such as mercury-containing equipment and polychlorinated biphenyls (PCBs)-containing equipment. The survey was conducted on November 20, 2018 and January 14, 2019 in accordance with Terracon proposal PJ1187144, dated October 12, 2018.

Interior building components and the site's roofing system were surveyed for homogeneous areas of suspect asbestos-containing materials (ACM) and lead-containing paint (LCP). Although reasonable effort was made to survey accessible suspect materials, additional suspect but un-sampled materials could be located in walls, in voids, below the ground or in other concealed areas. Suspect ACM samples were collected in general accordance with the sampling protocols outlined in United States Environmental Protection Agency (USEPA) 40 Code of Federal Regulations (CFR) Part 763 Subpart E 763.86, known as the Asbestos Hazard Emergency Response Act (AHERA). Samples were delivered to an accredited laboratory for analysis by Polarized Light Microscopy (PLM); PLM-NOB, (NOB non-friable organically bound) and TEM-NOB (TEM: transmission electron microscopy), as required by New York State regulations. Limited paint chip samples were obtained from representative surfaces potentially containing lead and analyzed by Flame Atomic Absorption (FAA) method for confirmation of lead content.

During execution of the asbestos survey and limited LCP sampling, Terracon made observations for mercury-containing equipment and PCBs-containing equipment which may need to be properly handled/disposed/recycled as part of the renovation project.

1.1 Project Objective

We understand the survey was requested to identify hazardous material items that need to be properly addressed as part of the renovation project pertaining to the Site.

2.0 ASBESTOS SURVEY

2.1 Field Activities

The survey was conducted by Mr. John Ellis, a New York state licensed asbestos inspector. A copy of Mr. Ellis's asbestos inspector credential is attached as Appendix F. A summary of survey activities is provided below.

2.1.1 Visual Assessment

Survey activities were initiated with visual observations of the building interior and building roofing system to identify homogeneous areas of suspect ACM. A homogeneous area (HA) consists of building materials that appear similar throughout in terms of color and texture with consideration given to the date of application. The assessment was conducted in visually accessible areas of the building proposed for renovation. The Site was occupied during our assessment.

Building materials identified as glass, wood, masonry, metal or rubber were not considered suspect ACM.

2.1.2 Physical Assessment

A physical assessment of each homogeneous area of suspect ACM was conducted to assess the friability and condition of the materials. A friable material is defined by the EPA as a material which can be crumbled, pulverized or reduced to powder by hand pressure when dry. Friability was assessed by physically touching suspect materials.

2.2 Sample Collection

Based on results of the visual observation, bulk samples of suspect ACM were collected in general accordance with USEPA AHERA sampling protocols. Samples of suspect materials were collected from randomly selected locations in each homogeneous area. Bulk samples were collected using wet methods as applicable to reduce the potential for fiber release. Samples were placed in sealable containers and labeled with unique sample numbers using an indelible marker.

The selection of sample locations and frequency of sampling were based on Terracon's observations and the assumption that like materials in the same area are homogeneous in content.

Terracon collected a total of 121 bulk samples from 26 homogeneous areas of suspect ACM from the Site. Drawings of suspect ACM bulk sample locations are located in Appendix A. A summary of suspect ACM samples collected during the survey is included in the Table 1 attached to this report in Appendix B.

2.3 Sample Analysis

Bulk samples were submitted under chain of custody to International Asbestos Testing Labaratories (iATL) of Mt. Laurel, New Jersey, a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP) accredited laboratory. EMSL is also accredited under the National Voluntary Laboratory Accreditation Program (NVLAP), accreditation number 101165-0.

As per NYSDOH-ELAP, all samples were analyzed using PLM. Friable materials were analyzed by PLM Method 198.1, and non-friable organically bound (NOB) materials (e.g., asphalt shingles and caulking) were analyzed using PLM-NOB Method 198.6. Per NYSDOH-ELAP, NOBs were additionally analyzed using TEM for a conclusive result.

2.4 Regulatory Overview

The asbestos NESHAP (40 CFR Part 61, Subpart M) regulates asbestos fiber emissions and asbestos waste disposal practices. The NESHAP regulation also requires the identification and classification of existing ACM according to friability prior to demolition or renovation activity. Friable ACM is a material containing more than 1% asbestos that, when dry, may be crumbled, pulverized or reduced to powder by hand pressure. All friable ACM is considered regulated asbestos-containing material (RACM).

The NESHAP regulation classifies ACM as either RACM, Category I non-friable ACM or Category II non-friable ACM. RACM includes all friable ACM, along with Category I and Category II non-friable ACM that has become friable or will be or has been subjected to sanding, grinding, cutting or abrading, or ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder in the course of renovation or demolition activity. Category I non-friable ACM are exclusively asbestos-containing packings, gaskets, resilient floor coverings, resilient floor covering mastics and asphalt roofing products that contain more than 1% asbestos. Category II non-friable ACM are all other non-friable materials other than Category I non-friable ACM that contain more than 1% asbestos.

In the State of New York, asbestos abatement activities are regulated by the New York State Department of Labor (NYSDOL) under the Part 56 of Title 12 of the Official Compilation of Codes, Rules and Regulations of the State of New York (12 NYCRR Part 56). New York regulations require that any asbestos-related activity conducted in the state be performed by personnel licensed by NYSDOL. NYSDOL 12 NYCRR has instituted nine different certifications for asbestos related activities that include: Handler; Allied Trades; Air Sampling Technician; Inspector; Operations and Maintenance; Supervisor; Project Designer; Project Monitor; and Management Planner. The owner or operator must provide the NYSDOL with written notification of planned pre-demolition activities and for ACM removal activities at least 10 working days prior to the commencement of a large project (greater than or equal to 160 square feet). Removal of ACM must be conducted by a State of New York certified asbestos abatement contractor.

The United States Occupational Safety and Health Administration (USOSHA) asbestos standard for construction (29 CFR 1926.1101) regulates workplace exposure to asbestos. The USOSHA standard requires that employee exposure to airborne asbestos fibers be maintained below 0.1 fibers per cubic centimeter of air (0.1 f/cc) as an eight-hour time weighted average (TWA) and not exceed 1.0 fibers per cubic centimeter of air (1.0 f/cc) over a 30-minute time period known as an excursion limit (EL). The TWA and EL are known as USOSHA's permissible exposure limits (PELs). The USOSHA standard classifies construction and maintenance activities which could disturb ACM, and specifies work practices and precautions which employers must follow when engaging in each class of regulated work.

2.5 Findings and Recommendations

Based on laboratory analysis pertaining to the samples collected during this survey, **no** materials sampled at the Site were identified to contain asbestos.

Laboratory analytical results are included in Appendix C.

3.0 LEAD-CONTAINING PAINT

3.1 Field Activities

The LCP sampling was conducted by Mr. John Ellis. A summary of LCP sampling activities is provided below.

3.1.1 Visual Observation

The LCP sampling was limited to readily observable and accessible interior surfaces and did not include building exterior other than the roof. Terracon cannot guarantee a building or property to be LCP free as the possibility exists that LCP coated surfaces may be hidden from sight or in inaccessible locations, or the homogeneous construction areas identified may not be truly homogeneous. This LCP sampling was not performed to comply with the HUD *Guidelines for the Evaluation and Control of Lead Containing Paint Hazards in Housing* standards. It should be understood that this LCP sampling is not considered to be comprehensive in nature, and the results are not intended to be used to determine lead hazards, develop abatement plans, or prepare detailed cost estimates for abatement. The sampling was meant rather to provide general information as to the likely presence of LCP at the Site so that contractors can take the appropriate precautions to protect their workers.

3.1.2 Visual Assessment

Our sampling activities began with visual observation of areas associated with the building's interior and building roofing system to identify apparent unique combinations of suspect LCP. A unique combination of paint is based on paint color, building component and substrate. Assessment was limited to visually accessible interior and exterior areas in the specified areas of the buildings.

3.2 Sample Analysis

Terracon conducted paint chip sampling that consisted of collecting 10 paint chip samples from the Site. Paint chip samples were submitted under chain of custody to EMSL for analysis by flame atomic absorption spectrometry per EPA SW-846/3050B/7000B. EMSL is accredited under the Environmental Lead Laboratory Accreditation Program (ELLAP) (ELLAP Accreditation No. 100194).

3.3 Regulatory Overview

Lead is regulated by the EPA, HUD, and OSHA. The EPA regulate lead use, removal, and disposal, and OSHA regulates lead exposure to workers. HUD regulates lead present in public housing. The EPA defines lead-based paint (LBP) as paint, varnish, stain, or other applied coating that contains lead equal to or greater than 1.0 mg/cm^2, 5,000 mg/kg, or 0.5% by dry weight as

determined by laboratory analysis. For the purpose of the OSHA lead standard, lead includes any detectable concentrations of metallic lead, all inorganic lead compounds, and organic lead soaps. A synopsis of the OSHA regulations (29 CFR 1926.62) and the applicability are as follows:

The OSHA *Lead Standard for Construction* (29 CFR 1926.62) applies to all construction work where an employee may be occupationally exposed to lead. All work related to construction, alteration, or repair (including painting and decorating) is included. **The lead-in-construction standard applies to any detectable concentration of lead in paint, as even small concentrations of lead can result in unacceptable employee exposures depending upon on the method of removal and other workplace conditions.**

Under the OSHA standard, construction includes, but is not limited to, the following:

- Demolition or salvage of structures where lead or materials containing lead are present
- Removal or encapsulation of materials containing lead
- New construction, alteration, repair, or renovation of structures, substrates, or portions containing lead, or materials containing lead
- Installation of products containing lead
- Lead contamination/emergency clean-up
- Transportation, disposal, storage, or containment of lead or materials containing lead on the site or location at which construction activities are performed
- Maintenance operations associated with construction activities described above

3.4 Findings and Recommendations

None of the paint chip samples were identified by the laboratory to contain detectable levels of lead, all below 0.5% by dry weight. A complete summary of the paint chip sampling is listed in Table 2 of Appendix B. Paint chip sampling analytical results are located in Appendix D.

Disturbance of any of the materials and/or components found to contain detectable levels of lead would require such activities be conducted in compliance with the requirements of the OSHA standard. Please note that this shall include any paints that may not have been tested as part of this limited sampling event; all paints at the Site should be assumed and treated as lead-containing. The OSHA regulations require that exposures to construction workers and general industry personnel be controlled by proper work procedures, proper worker training, respiratory protection, etc. Any renovation/demolition actions should utilize the proper exposure assessments, training, engineering controls, etc., and comply with the OSHA Construction Standards for Lead (29 CFR 1926.62). As such, personnel disturbing materials/components would need to have the OSHA level required training, comply with the work practices, levels of potential exposure documented and compared to the Action and Permissible Levels of 30 ug/m^3 and 50 ug/$m^{3,}$ respectively.

Torch cutting metals coated with lead concentrations should be avoided. Areas that must be torch cut to facilitate component removal should have the torch cut area coatings removed by lead removal contractor personnel prior to the torch cutting in accordance with the requirements of the OSHA Lead Construction Standards.

During demolition activities, the removal of LCP components may need to be removed and segregated from the waste stream by a contractor with lead experience and training in accordance with the OSHA lead requirements.

Regarding LCP disposal, removed coatings and components should be segregated from the renovation/demolition waste stream and coatings tested for leachate lead in accordance with Toxicity Characteristics Leachate Procedure (TCLP).

Metal building components removed intact can be exempt from TCLP testing, if removed and sent for recycling. Recycled scrap metal would be exempt from EPA Resource Conservation and Recovery Act (RCRA), 40 CFR Part 261.

Any chips, dusts, contaminated soils and sludge containing lead based paint debris generated by the demolition or renovation would have to be characterized and managed in accordance with the RCRA hazardous waste rules.

4.0 VISUAL REGULATED MATERIALS SURVEY

4.1 Field Activities

During the asbestos survey and LCP sampling activities, Terracon made observations for suspect PCB and mercury-containing equipment.

4.1 Regulatory Overview

The United States Environmental Protection Agency (USEPA) regulates PCB waste under 40 Code of Federal Regulations (CFR) 761.62 of the Toxic Substances Control Act (TSCA). Equipment such as transformers and light ballasts may contain mineral oil with minor amounts of PCBs and could be considered “PCB contaminated” (PCB content 50-500 ppm).

Certain mercury-containing equipment is covered under the Universal Waste regulation (40 CFR 273.9); other mercury wastes are regulated under the Resource Conservation and Recovery Act (RCRA) and are considered hazardous if the waste exceeds the toxicity characteristic leacheate procedure (TCLP) level of 0.2 milligrams per liter (mg/L) for mercury.

The generator is responsible for compliance with applicable regulations regarding hazardous waste disposal.

4.2 Findings and Recommendations

Findings

No suspect hazardous and regulated materials were observed by Terracon.

5.0 GENERAL COMMENTS

This asbestos survey and lead-containing paint sampling were conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing under similar conditions in the same locale. The results, findings, conclusions and recommendations expressed in this report are based on conditions observed during our survey of the buildings. The information contained in this report is relevant to the date on which this survey was performed, and should not be relied upon to represent conditions at a later date. This report has been prepared on behalf of and exclusively for use by WE Acquisitions, LLC. This report is not a bidding document. Contractors or consultants reviewing this report must draw their own conclusions regarding further investigation or remediation deemed necessary. Terracon does not warrant the work of regulatory agencies, laboratories or other third parties supplying information which may have been used in the preparation of this report. No warranty, express or implied is made.

PLM BULK SAMPLE ANALYSIS SUMMARY

Lab No.: 6660443 **Analyst Observation:** White Drywall **Location:** Basement Stairway
Client No.: 01D-WB2-01 **Client Description:** Gypsum Wallboard **Facility:**

Percent Asbestos: *None Detected*
Percent Non-Asbestos Fibrous Material: 1 Cellulose, 1 Fibrous Glass
Percent Non-Fibrous Material: 98

Lab No.: 6660444 **Analyst Observation:** White Drywall **Location:** Basement Stairway
Client No.: 01D-WB2-02 **Client Description:** Gypsum Wallboard **Facility:**

Percent Asbestos: *None Detected*
Percent Non-Asbestos Fibrous Material: 1 Cellulose, 1 Fibrous Glass
Percent Non-Fibrous Material: 98

Lab No.: 6660445 **Analyst Observation:** White Drywall **Location:** Laundry Room
Client No.: 01D-WB2-03 **Client Description:** Gypsum Wallboard **Facility:**

Percent Asbestos: *None Detected*
Percent Non-Asbestos Fibrous Material: 1 Cellulose, 1 Fibrous Glass
Percent Non-Fibrous Material: 98

Lab No.: 6660446 **Analyst Observation:** White Joint Compound **Location:** Basement Stairway
Client No.: 01D-WB3-04 **Client Description:** Joint Compound **Facility:**

Percent Asbestos: *None Detected*
Percent Non-Asbestos Fibrous Material: None Detected
Percent Non-Fibrous Material: 100

Lab No.: 6660447 **Analyst Observation:** White Joint Compound **Location:** Master Bath
Client No.: 01D-WB3-05 **Client Description:** Joint Compound **Facility:**

Percent Asbestos: *None Detected*
Percent Non-Asbestos Fibrous Material: None Detected
Percent Non-Fibrous Material: 100

Lab No.: 6660448 **Analyst Observation:** White Joint Compound **Location:** Bedroom 2 Closet
Client No.: 01D-WB3-06 **Client Description:** Joint Compound **Facility:**

Percent Asbestos: *None Detected*
Percent Non-Asbestos Fibrous Material: None Detected
Percent Non-Fibrous Material: 100

Appendix to Analytical Report

Customer Contact: John Ellis
Method: US EPA 600, R93-116

This appendix seeks to promote greater understanding of any observations, exceptions, special instructions, or circumstances that the laboratory needs to communicate to the client concerning the above samples. The information below is used to help promote your ability to make the most informed decisions for you and your customers. Please note the following points of contact for any questions you may have.

iATL Customer Service: customerservice@iatl.com
iATL Office Manager: cdavis@iatl.com
iATL Account Representative: Cassie Doherty
Sample Login Notes: See Batch Sheet Attached
Sample Matrix: Bulk Building Materials
Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and ir our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:

Analysis by US EPA 600 93-116: Determination of Asbestos in Bulk Building Materials by Polarized Light Microscopy (PLM).

Certifications:

- NIST-NVLAP No. 101165-0
- NYSDOH-ELAP No. 11021
- AIHA-LAP, LLC No. 100188

Quantification at <0.25% by volume is possible with this method. (PC) Indicates Stratified Point Count Method performed. (PC-Trace) means that asbestos was detected but is not quantifiable under the Point Counting regimen. PC Trace represents a <0.25% amount. Analysis includes all distinct separable layers in accordance with EPA 600 Method. If not reported or otherwise noted, layer is either not present or the client has specifically requested that it not be analyzed (ex. analyze until positive instructions). Small asbestos fibers may be missed by PLM due to resolution limitations of the optical microscope. Therefore, PLM is not consistently reliable in detecting asbestos in non-friable organically bound (NOB) materials. Quantitative transmission electron microscopy (TEM) is currently the only method that can pronounce materials as non-asbestos containing.

Analytical Methodology Alternatives: Your initial request for analysis may not have accounted for recent advances in regulatory requirements or advances in technology that are routinely used in similar situations for other qualified projects. You may have the option to explore additional analysis for further information. Below are a few options, listed as the matrix followed by the appropriate methodology. Also included are links to more information on our website.

Bulk Building Materials that are Non-Friable Organically Bound (NOB) by Gravimetric Reduction techniques employing PLM and TEM: ELAP 198.6 (PLM-NOB), ELAP 198.4 (TEM-NOB)

Loose Fill Vermiculite Insulation, Attic Insulation, Zonolite (copyright), etc.: US EPA 600 R-4/004 (multi-tiered analytical process)

9000 Commerce Parkway Suite B
Mt. Laurel, New Jersey 08054
Telephone: 856-231-9449
Email: customerservice@iatl.com

CERTIFICATE OF ANALYSIS

Client: Terracon
201 Hammer Mill Rd
Rocky Hill CT 06067

Client: TER272

Report Date: 12/4/2018
Report No.: 578251 - PLM
Project: Florida, NY
Project No.: J1187144

Sprayed On Insulation/Fireproofing with Vermiculite (SOF-V): ELAP 198.8 (PLM-SOF-V)

Soil, sludge, sediment, aggregate, and like materials analyzed for asbestos or other elongated mineral particles (ex. erionite, etc.): ASTM D7521, CARB 435, and other options available

Asbestos in Surface Dust according to one of ASTM's Methods (very dependent on sampling collection technique – by TEM): ASTM D 5755, D5756, or D6480

Various other asbestos matrices (air, water, etc.) and analytical methods are available.

Disclaimers / Qualifiers:

There may be some samples in this project that have a "NOTE:" associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a list with highlighted disclaimers that may be pertinent to this project. For a full explanation of these and other disclaimers, please inquire at **customerservice@iatl.com**.

1) Note: No mastic provided for analysis.
2) Note: Insufficient mastic provided for analysis.
3) Note: Insufficient material provided for analysis.
4) Note: Insufficient sample provided for QC reanalysis.
5) Note: Different material than indicated on Sample Log / Description.
6) Note: Sample not submitted.
7) Note: Attached to asbestos containing material.
8) Note: Received wet.
9) Note: Possible surface contamination.
10) Note: Not building material. 1% threshold may not apply.
11) Note: Recommend TEM-NOB analysis as per EPA recommendations.
12) Note: Asbestos detected but not quantifiable.
13) Note: Multiple identical samples submitted, only one analyzed.
14) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.080%.
15) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.125%.
16) Note: This sample contains >10% vermiculite mineral. See Appendix for Recommendations for Vermiculite Analysis.

Recommendations for Vermiculite Analysis:

Several analytical protocols exist for the analysis of asbestos in vermiculite. These analytical approaches vary depending upon the nature of the vermiculite mineral being tested (e.g. un-processed gange, homogeneous exfoliated books of mica, or mixed mineral composites).Please contact your client representative for pricing and turnaround time options available.

iATL recommends initial testing using the EPA 600/R-93/116 method. This method is specifically designed for the analysis of asbestos in bulk building materials. It provides an acceptable starting point for primary screening of vermiculite for possible asbestos.

Results from this testing may be inconclusive. EPA suggests proceeding to a multi-tiered analysis involving wet separation techniques in conjunction with PLM and TEM gravimetric analysis (EPA 600/R-04/004).

For New York State customers, NYSDOH requires disclaimers and qualifiers for various vermiculite containing samples that direct analysis via ELAP198.6 and ELAP198.8 for samples that contain >10% vermiculite mineral where ELAP198.6 may be used to evaluate the asbestos content of the material. However, any test result using ELAP198.6 will be reported with the following disclaimer: “ELAP198.6 method does not remove vermiculite and may underestimate the level of asbestos present in a sample containing >10% vermiculite.”

Further information on this method and other vermiculite and asbestos issues can be found at the following: Agency for Toxic Substances and Disease Registry (ATSDR) www.atsdr.cdc.gov, United States Geological Survey (USGS) www.minerals.usgs.gov/minerals/, US EPA www.epa.gov/asbestos. The USEPA also has an informative brochure "Current Best Practices for Vermiculite Attic Insulation" EPA 747F03001 May 2003, that may assist the health and remediation professional.

The following is a summary of the analytical process outlines in the EPA 600/R-04/004 Method:

1)**Analytical Step/Method:** Initial Screening by PLM, EPA 600R-93/116
Requirements/Comments: Minimum of 0.1 g of sample. ~0.25% LOQ for most samples.

2)**Analytical Step/Method:** Wet Separation by PLM Gravimetric Technique, EPA R-04/004
Requirements/Comments: Minimum 50g** of dry sample. Analysis of "Sinks" only.

9000 Commerce Parkway Suite B
Mt. Laurel, New Jersey 08054
Telephone: 856-231-9449
Email: customerservice@iatl.com

Sample Matrix: Bulk material, Non-Friable Organically Bound material such as VSF, FT, M, RM, Tar, CB, Shingle, Tar Paper, Caulk, Glazing
Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and ir our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:

Analysis by ELAP Section 198.4

Certifications:

- NIST-NVLAP No. 101165-0
- NYSDOH-ELAP No. 11021
- AIHA-LAP, LLC No. 100188

All results are based on the samples as received at the lab. iATL assumes that appropriate sampling methods have been used and that the data upon which these results are based have been accurately supplied by the client.

The "Gravimetrically Reduced Subsample" is the portion of the submitted sample remaining following the ashing and acid treatment processes. TEM analysis occurs on this portion of the sample.

Final results are calculated to represent the sample as submitted. Results are verifiable for only those operations and analyses performed in the laboratory.

Disclaimers / Qualifiers:

There may be some samples in this project that have a "NOTE:" associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a complete list with highlighted disclaimers pertinent to this project. For a full explanation of these and other disclaimers, please inquire at **customerservice@iatl.com.**

(1)Note: Sample not analyzed.
(2)Note: Sample not analyzed at request of client.
(3)Note: Sample analysis terminated. Clearance criteria exceeded (average >70.0 s/mm²). Set fails by AHERA 40 CFR 763.
(4)Note: Heavy loading (>0.1 s/cc) of non-asbestos particulate that might prohibit the required morphological, diffraction and elemental identification of asbestos. The absence of asbestos on the sample can not be concluded. Analysis for informational purposes only.
(5)Note: Heavy loading (>10% per grid opening) non-fibrous particulate. Sample analysis terminated. Clearance criteria exceeded (>10%). Sample voided by AHERA 40 CFR 763.
(5A)Note: Heavy loading (>25% per grid opening) non-fibrous particulate. Sample analysis terminated. Clearance criteria exceeded (>25%). Sample voided by NIOSH 7402.
(6)Note: Sample turbidity >1.0 NTU. Therefore MDL >> 0.1 MFL. Does not meet National Primary Drinking Water Standards.
(7)Note: Sample integrity compromised. Received sample cassette with top open (40 CFR 763 c-e).
(8)Note: Received sample cassettes with portion of filter missing. "PCM re-prep"
(9)Note: Void - overloaded, unable to prep.
(10)Note: Void - filter damaged.
(11)Note: No volume supplied.
(12)Note: Heavy loading (>0.1 s/cc) of non-asbestos / non-fibrous particulate.
(13)Note: Method analytical sensitivity of <0.003 s/cc not attained due to volume of air sampled. NIOSH requires a minimum of 400L.
(13A)Note: Volume does not meet AHERA requirements.(<1188 L)
(14)Note: Geometric Mean = 0.xxxx Structures/cc
(15)Note: Samples received on 0.8 micron PCM filters. Samples must be submitted on 0.45 micron filter cassettes per AHERA guidelines
(18)Note: *Results are for informational purposes only. Samples received on 0.8um PCM cassettes. Per AHERA 40 CFR 763 guidelines samples must be obtained on a 0.45um cassette.
(TEM NOB 1) Note: The above result represents only the analysis of NOB-residue submitted from the client.
(TEM NOB 2) Note: Insufficient material (<100mg) to verify results.

Appendix to Analytical Report:

Customer Contact: John Ellis
Method: ELAP Section 198.6

This appendix seeks to promote greater understanding of any observations, exceptions, special instructions, or circumstances that the laboratory needs to communicate to the client concerning the above samples. The information below is used to help promote your ability to make the most informed decisions for you and your customers. Please note the following points of contact for any questions you may have.

iATL Customer Service: customerservice@iatl.com
iATL Office Manager: cdavis@iatl.com
iATL Account Representative: Cassie Doherty
Sample Login Notes: See Batch Sheet Attached
Sample Matrix: Bulk materials described as Non Fibrous Organically Bound such as FT, SVF, M, RM, Tar, Tar Paper, Shingle, CB etc.
Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and ir our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:

Analysis by ELAP Section 198.6

Certifications:

- NIST-NVLAP No. 101165-0
- NYSDOH-ELAP No. 11021
- AIHA-LAP, LLC No. 100188

All results are based on the samples as received at the lab. iATL assumes that appropriate sampling methods have been used and that the data upon which these results are based have been accurately supplied by the client.

Quantification at <0.25% by volume is possible with this method.

(PC) Indicates Stratified Point Count Method performed.

(PC-Trace) means that asbestos was detected but is not quantifiable under the Point Counting regimen.

Analysis includes all distinct separable layers in accordance with EPA 600 Method. If not reported or otherwise noted, layer is either not present or the client has specifically requested that it not be analyzed (ex. analyze until positive instructions).

CERTIFICATE OF ANALYSIS

Client:	Terracon	Report Date:	12/4/2018
	201 Hammer Mill Rd	Report No.:	578251 - PLM NOB
	Rocky Hill CT 06067	Project:	Florida, NY
		Project No.:	J1187144
Client:	TER272		

Small asbestos fibers may be missed by PLM due to resolution limitations of the optical microscope. Therefore, PLM is not consistently reliable in detecting asbestos in non-friable organically bound (NOB) materials. Quantitative transmission electron microscopy (TEM) is currently the only method that can pronounce materials as non-asbestos containing.

Disclaimers / Qualifiers:

There may be some samples in this project that have a "NOTE:" associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a complete list with highlighted disclaimers pertinent to this project. For a full explanation of these and other disclaimers, please inquire at **customerservice@iatl.com.**

1) Note: No mastic provided for analysis.
2) Note: Insufficient mastic provided for analysis.
3) Note: Insufficient material provided for analysis.
4) Note: Insufficient sample provided for QC reanalysis.
5) Note: Different material than indicated on Sample Log / Description.
6) Note: Sample not submitted.
7) Note: Attached to asbestos containing material.
8) Note: Received wet.
9) Note: Possible surface contamination.
10) Note: Not building material. 1% threshold may not apply.
11) Note: Recommend TEM-NOB analysis as per EPA recommendations.
12) Note: Asbestos detected but not quantifiable.
13) Note: Multiple identical samples submitted, only one analyzed.
14) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.080%.
15) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.125%.

Appendix to Analytical Report

Customer Contact: John Ellis
Method: NYSDOH - ELAP Method 198.1

This appendix seeks to promote greater understanding of any observations, exceptions, special instructions, or circumstances that the laboratory needs to communicate to the client concerning the above samples. The information below is used to help promote your ability to make the most informed decisions for you and your customers. Please note the following points of contact for any questions you may have.

iATL Customer Service: customerservice@iatl.com
iATL Office Manager: cdavis@iatl.com
iATL Account Representative: Cassie Doherty
Sample Login Notes: See Batch Sheet Attached
Sample Matrix: Bulk Building Materials
Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and ir our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:

Analysis by US EPA 600 93-116: Determination of Asbestos in Bulk Building Materials by Polarized Light Microscopy (PLM), or NYSDOH ELAP Method 198.1, Polarized Light Microscope for Identifying and Quantitating Asbestos in Bulk Samples

Certifications:

- NIST-NVLAP No. 101165-0
- NYSDOH-ELAP No. 11021
- AIHA-LAP, LLC No. 100188

Quantification at <0.25% by volume is possible with this method. (PC) Indicates Stratified Point Count Method performed. (PC-Trace) means that asbestos was detected but is not quantifiable under the Point Counting regimen. PC Trace represents a <0.25% amount. Analysis includes all distinct separable layers in accordance with EPA 600 Method. If not reported or otherwise noted, layer is either not present or the client has specifically requested that it not be analyzed (ex. analyze until positive instructions). Small asbestos fibers may be missed by PLM due to resolution limitations of the optical microscope. Therefore, PLM is not consistently reliable in detecting asbestos in non-friable organically bound (NOB) materials. Quantitative transmission electron microscopy (TEM) is currently the only method that can pronounce materials as non-asbestos containing.

Analytical Methodology Alternatives: Your initial request for analysis may not have accounted for recent advances in regulatory requirements or advances in technology that are routinely used in similar situations for other qualified projects. You may have the option to explore additional analysis for further information. Below are a few options, listed as the matrix followed by the appropriate methodology. Also included are links to more information on our website.

Bulk Building Materials that are Non-Friable Organically Bound (NOB) by Gravimetric Reduction techniques employing PLM and TEM: ELAP 198.6 (PLM-NOB), ELAP 198.4 (TEM-NOB)

CERTIFICATE OF ANALYSIS

Client:	Terracon	Report Date:	12/4/2018
	201 Hammer Mill Rd	Report No.:	578252 - PLM
	Rocky Hill CT 06067	Project:	Florida, NY
		Project No.:	J1187144
Client:	TER272		

Loose Fill Vermiculite Insulation, Attic Insulation, Zonolite (copyright), etc.: US EPA 600 R-4/004 (multi-tiered analytical process)
Sprayed On Insulation/Fireproofing with Vermiculite (SOF-V): ELAP 198.8 (PLM-SOF-V)

Soil, sludge, sediment, aggregate, and like materials analyzed for asbestos or other elongated mineral particles (ex. erionite, etc.): ASTM D7521, CARB 435, and other options available

Asbestos in Surface Dust according to one of ASTM's Methods (very dependent on sampling collection technique – by TEM): ASTM D 5755, D5756, or D6480

Various other asbestos matrices (air, water, etc.) and analytical methods are available.

Disclaimers / Qualifiers:

There may be some samples in this project that have a "NOTE:" associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a list with highlighted disclaimers that may be pertinent to this project. For a full explanation of these and other disclaimers, please inquire at **customerservice@iatl.com**.

1) Note: No mastic provided for analysis.
2) Note: Insufficient mastic provided for analysis.
3) Note: Insufficient material provided for analysis.
4) Note: Insufficient sample provided for QC reanalysis.
5) Note: Different material than indicated on Sample Log / Description.
6) Note: Sample not submitted.
7) Note: Attached to asbestos containing material.
8) Note: Received wet.
9) Note: Possible surface contamination.
10) Note: Not building material. 1% threshold may not apply.
11) Note: Recommend TEM-NOB analysis as per EPA recommendations.
12) Note: Asbestos detected but not quantifiable.
13) Note: Multiple identical samples submitted, only one analyzed.
14) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.080%.
15) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.125%.
16) Note: This sample contains >10% vermiculite mineral. See Appendix for Recommendations for Vermiculite Analysis.

Recommendations for Vermiculite Analysis:

Several analytical protocols exist for the analysis of asbestos in vermiculite. These analytical approaches vary depending upon the nature of the vermiculite mineral being tested (e.g. un-processed gange, homogeneous exfoliated books of mica, or mixed mineral composites).Please contact your client representative for pricing and turnaround time options available.

iATL recommends initial testing using the EPA 600/R-93/116 method. This method is specifically designed for the analysis of asbestos in bulk building materials. It provides an acceptable starting point for primary screening of vermiculite for possible asbestos.

Results from this testing may be inconclusive. EPA suggests proceeding to a multi-tiered analysis involving wet separation techniques in conjunction with PLM and TEM gravimetric analysis (EPA 600/R-04/004).

For New York State customers, NYSDOH requires disclaimers and qualifiers for various vermiculite containing samples that direct analysis via ELAP198.6 and ELAP198.8 for samples that contain >10% vermiculite mineral where ELAP198.6 may be used to evaluate the asbestos content of the material. However, any test result using ELAP198.6 will be reported with the following disclaimer: “ELAP198.6 method does not remove vermiculite and may underestimate the level of asbestos present in a sample containing >10% vermiculite.”

Further information on this method and other vermiculite and asbestos issues can be found at the following: Agency for Toxic Substances and Disease Registry (ATSDR) www.atsdr.cdc.gov, United States Geological Survey (USGS) www.minerals.usgs.gov/minerals/, US EPA www.epa.gov/asbestos. The USEPA also has an informative brochure "Current Best Practices for Vermiculite Attic Insulation" EPA 747F03001 May 2003, that may assist the health and remediation professional.

The following is a summary of the analytical process outlines in the EPA 600/R-04/004 Method:

1)**Analytical Step/Method:** Initial Screening by PLM, EPA 600R-93/116
Requirements/Comments: Minimum of 0.1 g of sample. ~0.25% LOQ for most samples.

2)**Analytical Step/Method:** Wet Separation by PLM Gravimetric Technique, EPA R-04/004
Requirements/Comments: Minimum 50g** of dry sample. Analysis of "Sinks" only.

TEM BULK SAMPLE ANALYSIS SUMMARY

Lab No.: 6660543
Client No.: 1C-RF5-72
Description: Black Shingle
% Asbestos Detected:
None Detected

Client Description: Asphalt Shingle
Facility:
Location: Lean-To Shed
% Non-Asbestos Fibrous Material:
None Detected

Organic Fraction: 98.9 %
Gravimetrically Reduced Subsample: 1.1%
% Non-Fibrous Material:
1.1 Other

Lab No.: 6660544
Client No.: 1C-RF5-73
Description: Black/Brown Shingle
% Asbestos Detected:
Trace *Chrysotile, Detected at <0.25%*

Client Description: Asphalt Shingle
Facility:
Location: Lean-To Shed
% Non-Asbestos Fibrous Material:
None Detected

Organic Fraction: 89.3 %
Gravimetrically Reduced Subsample: 10.7%
% Non-Fibrous Material:
10.7 Other

Lab No.: 6660545
Client No.: 1C-RF5-74
Description: Black/Brown Shingle
% Asbestos Detected:
None Detected

Client Description: Asphalt Shingle
Facility:
Location: Lean-To Shed
% Non-Asbestos Fibrous Material:
None Detected

Organic Fraction: 90.9 %
Gravimetrically Reduced Subsample: 9.1%
% Non-Fibrous Material:
9.1 Other

Client:	Terracon	Report Date:	12/4/2018
	201 Hammer Mill Rd	Report No.:	578252 - TEM NOB
	Rocky Hill CT 06067	Project:	Florida, NY
		Project No.:	J1187144
Client:	TER272		

Appendix to Analytical Report:

Customer Contact: John Ellis
Analysis: NYSDOH ELAP Section 198.4
This appendix seeks to promote greater understanding of any observations, exceptions, special instructions, or circumstances that the laboratory needs to communicate to the client concerning the above samples. The information below is used to help promote your ability to make the most informed decisions for you and your customers. Please note the following points of contact for any questions you may have.
iATL Customer Service: customerservice@iatl.com
iATL Office Manager: cdavis@iatl.com
iATL Account Representative: Cassie Doherty
Project Summary:
Sample Login Notes: See Batch Sheet Attached
Sample Matrix: Bulk material, Non-Friable Organically Bound material such as VSF, FT, M, RM, Tar, CB, Shingle, Tar Paper, Caulk, Glazing

Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and in our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:
Analysis by: NYSDOH ELAP Section 198.4

Certification: NIST-NVLAP No. 101165-0
NYSDOH-ELAP No. 11021
AIHA-LAP, LLC No. 100188

All results are based on the samples as received at the lab. iATL assumes that appropriate sampling methods have been used and that the data upon which these results are based have been accurately supplied by the client.

The "Gravimetrically Reduced Subsample" is the portion of the submitted sample remaining following the ashing and acid treatment processes. TEM analysis occurs on this portion of the sample.

9000 Commerce Parkway Suite B

CERTIFICATE OF ANALYSIS

Client:	Terracon	Report Date:	12/4/2018
	201 Hammer Mill Rd	Report No.:	578252 - TEM NOB
	Rocky Hill CT 06067	Project:	Florida, NY
		Project No.:	J1187144
Client:	TER272		

Final results are calculated to represent the sample as submitted. Results are verifiable for only those operations and analyses performed in the laboratory.

Disclaimers / Qualifiers:

There may be some samples in this project that have a "NOTE:" associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a complete list with highlighted disclaimers pertinent to this project. For a full explanation of these and other disclaimers, please inquire at **customerservice@iatl.com.**

(1)Note: Sample not analyzed.
(2)Note: Sample not analyzed at request of client.
(3)Note: Sample analysis terminated. Clearance criteria exceeded (average >70.0 s/mm²). Set fails by AHERA 40 CFR 763.
(4)Note: Heavy loading (>0.1 s/cc) of non-asbestos particulate that might prohibit the required morphological, diffraction and elemental identification of asbestos. The absence of asbestos on the sample can not be concluded. Analysis for informational purposes only.
(5)Note: Heavy loading (>10% per grid opening) non-fibrous particulate. Sample analysis terminated. Clearance criteria exceeded (>10%). Sample voided by AHERA 40 CFR 763.
(5A)Note: Heavy loading (>25% per grid opening) non-fibrous particulate. Sample analysis terminated. Clearance criteria exceeded (>25%). Sample voided by NIOSH 7402.
(6)Note: Sample turbidity >1.0 NTU. Therefore MDL >> 0.1 MFL. Does not meet National Primary Drinking Water Standards.
(7)Note: Sample integrity compromised. Received sample cassette with top open (40 CFR 763 c-e).
(8)Note: Received sample cassettes with portion of filter missing. "PCM re-prep"
(9)Note: Void - overloaded, unable to prep.
(10)Note: Void - filter damaged.
(11)Note: No volume supplied.
(12)Note: Heavy loading (>0.1 s/cc) of non-asbestos / non-fibrous particulate.
(13)Note: Method analytical sensitivity of <0.003 s/cc not attained due to volume of air sampled. NIOSH requires a minimum of 400L.
(13A)Note: Volume does not meet AHERA requirements.(<1188 L)
(14)Note: Geometric Mean = 0.xxxx Structures/cc
(15)Note: Samples received on 0.8 micron PCM filters. Samples must be submitted on 0.45 micron filter cassettes per AHERA guidelines
(18)Note: *Results are for informational purposes only. Samples received on 0.8um PCM cassettes. Per AHERA 40 CFR 763 guidelines samples must be obtained on a 0.45um cassette.
(TEM NOB 1) Note: The above result represents only the analysis of NOB-residue submitted from the client.
(TEM NOB 2) Note: Insufficient material (<100mg) to verify results.

Report Date: 12/4/2018
Report No.: 578252 - PLM NOB Rev #3, 12/28/2018
Project: Florida, NY
Project No.: J1187144

PLM NOB SAMPLE ANALYSIS SUMMARY

Lab No.: 6660543 **Description:** Black Shingle **Location:** Lean-To Shed
Client No.: 1C-RF5-72 **Client Description:** Asphalt Shingle **Facility:**

Percent Asbestos:	Percent Non-Asbestos Fibrous Material:	Percent Non-Fibrous Material:
None Detected	None Detected	1.1

Lab No.: 6660544 **Description:** Black/Brown Shingle **Location:** Lean-To Shed
Client No.: 1C-RF5-73 **Client Description:** Asphalt Shingle **Facility:**

Percent Asbestos:	Percent Non-Asbestos Fibrous Material:	Percent Non-Fibrous Material:
None Detected	None Detected	11

Lab No.: 6660545 **Description:** Black/Brown Shingle **Location:** Lean-To Shed
Client No.: 1C-RF5-74 **Client Description:** Asphalt Shingle **Facility:**

Percent Asbestos:	Percent Non-Asbestos Fibrous Material:	Percent Non-Fibrous Material:
None Detected	None Detected	9.1

Please refer to the Appendix of this report for further information regarding your analysis, test method, and accreditation.

Appendix to Analytical Report:

Customer Contact: John Ellis
Method:NYSDOH ELAP Section 198.6
This appendix seeks to promote greater understanding of any observations, exceptions, special instructions, or circumstances that the laboratory needs to communicate to the client concerning the above samples. The information below is used to help promote your ability to make the most informed decisions for you and your customers. Please note the following points of contact for any questions you may have.
iATL Customer Service: customerservice@iatl.com
iATL Office Manager: cdavis@iatl.com
iATL Account Representative: Cassie Doherty
Project Summary:
Sample Login Notes: See Batch Sheet Attached
Sample Matrix: Bulk materials described as Non Fibrous Organically Bound such as FT, SVF, M, RM, Tar, Tar Paper, Shingle, CB etc.
Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and in our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:
Analysis by NYSDOH ELAP Section 198.6

Certification: NIST-NVLAP No. 101165-0
NYSDOH-ELAP No. 11021
AIHA-LAP, LLC No. 100188
All results are based on the samples as received at the lab. iATL assumes that appropriate sampling methods have been used and that the data upon which these results are based have been accurately supplied by the client.

Quantification at <0.25% by volume is possible with this method.

(PC) Indicates Stratified Point Count Method performed.

(PC-Trace) means that asbestos was detected but is not quantifiable under the Point Counting regimen.

CERTIFICATE OF ANALYSIS

Client:	Terracon	Report Date:	12/4/2018
	201 Hammer Mill Rd	Report No.:	578252 - PLM NOB
	Rocky Hill CT 06067	Project:	Florida, NY
		Project No.:	J1187144
Client:	TER272		

Analysis includes all distinct separable layers in accordance with EPA 600 Method. If not reported or otherwise noted, layer is either not present or the client has specifically requested that it not be analyzed (ex. analyze until positive instructions).

Disclaimer from Item 198.6,Sec. 6.3.2.2. "Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos containing."

Disclaimers / Qualifiers:

There may be some samples in this project that have a “NOTE:” associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a complete list with highlighted disclaimers pertinent to this project. For a full explanation of these and other disclaimers, please inquire at customerservice@iatl.com.

1) Note: No mastic provided for analysis.
2) Note: Insufficient mastic provided for analysis.
3) Note: Insufficient material provided for analysis.
4) Note: Insufficient sample provided for QC reanalysis.
5) Note: Different material than indicated on Sample Log / Description.
6) Note: Sample not submitted.
7) Note: Attached to asbestos containing material.
8) Note: Received wet.
9) Note: Possible surface contamination.
10) Note: Not building material. 1% threshold may not apply.
11) Note: Recommend TEM-NOB analysis as per EPA recommendations.
12) Note: Asbestos detected but not quantifiable.
13) Note: Multiple identical samples submitted, only one analyzed.
14) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.080%.
15) Note: Analyzed by EPA 600/R-93/116. Point Counting detection limit at 0.125%.

NOB = Non Friable Organically Bound N/A = Not Applicable VCM = Vermiculite Containing Material

-In New York State, TEM is currently the only method that can be used to determine if NOB materials can be considered or treated as non-asbestos containing.
All samples examined for the presence of vermiculite when analyzed via NYS 198.1.
-NYS Guidelines for Vermiculite containing samples are available at http://www.wadsworth.org/labcert/elapcert/forms/VermiculiteInterimGuidance_Rev070913.pdf
EMSL maintains liability limited to cost of analysis. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. Interpretation and use of test results are the responsibility of the client. Samples were received in good condition unless otherwise noted.
This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government. This report may contain data that is not covered by the NVLAP accreditation.

Appendix to Analytical Report:

Customer Contact: John Ellis
Method: ASTM D3335-85a, US EPA SW846 3050B:7000B

This appendix seeks to promote greater understanding of any observations, exceptions, special instructions, or circumstances that the laboratory needs to communicate to the client concerning the above samples. The information below is used to help promote your ability to make the most informed decisions for you and your customers. Please note the following points of contact for any questions you may have.

iATL Customer Service: customerservice@iatl.com
iATL Office Manager: cdavis@iatl.com
iATL Account Representative: Cassie Doherty
Sample Login Notes: See Batch Sheet Attached
Sample Matrix: Paint
Exceptions Noted: See Following Pages

General Terms, Warrants, Limits, Qualifiers:

General information about iATL capabilities and client/laboratory relationships and responsibilities are spelled out in iATL policies that are listed at www.iATL.com and ir our Quality Assurance Manual per ISO 17025 standard requirements. The information therein is a representation of iATL definitions and policies for turnaround times, sample submittal, collection media, blank definitions, quantification issues and limit of detection, analytical methods and procedures, sub-contracting policies, results reporting options, fees, terms, and discounts, confidentiality, sample archival and disposal, and data interpretation.

iATL warrants the test results to be of a precision normal for the type and methodology employed for each sample submitted. iATL disclaims any other warrants, expressed or implied, including warranty of fitness for a particular purpose and warranty of merchantability. iATL accepts no legal responsibility for the purpose for which the client uses test results. Any analytical work performed must be governed by our Standard Terms and Conditions. Prices, methods and detection limits may be changed without notification. Please contact your Customer Service Representative for the most current information.

This confidential report relates only to those item(s) tested and does not represent an endorsement by NIST-NVLAP, AIHA LAP LLC, or any agency of local, state or province governments nor of any agency of the U.S. government.

This report shall not be reproduced except in full, without written approval of the laboratory.

Information Pertinent to this Report:

Analysis by ASTM D3335-85a by AAS

Certification:
- National Lead Laboratory Program (NLLAP): AIHA-LAP, LLC No. 100188
- NYSDOH-ELAP No. 11021

Regulatory limit is 0.5% lead by weight (EPA/HUD guidelines). Recommend multiple sampling for all samples less than regulatory limit for confirmation.
All results are based on the samples as received at the lab. iATL assumes that appropriate sampling methods have been used and that the data upon which these results are based have been accurately supplied by the client.
Method Detection Limit (MDL) per EPA Method 40CFR Part 136 Apendix B.
Reporting Limit (RL) based upon Lowest Standard Determined (LSD) in accordance with AIHA-ELLAP policies.
LSD=0.2 ppm MDL=0.005% by weight. RL= 0.010% by weight (based upon 100 mg sampled).

Disclaimers / Qualifiers:

There may be some samples in this project that have a "NOTE:" associated with a sample result. We use added disclaimers or qualifiers to inform the client about something that requires further explanation. Here is a complete list with highlighted disclaimers pertinent to this project. For a full explanation of these and other disclaimers, please inquire at **customerservice@iatl.com.**

* Insufficient sample provided to perform QC reanalysis (<200 mg)
** Not enough sample provided to analyze (<50 mg)
*** Matrix / substrate interference possible.

This is to certify that this map or plat and the survey on which it is based were made in accordance with the 2016 Minimum Standard Detail Requirements for ALTA/NSPS Land Title Surveys, jointly established and adopted by ALTA and NSPS, and includes items 1, 2, 3, 4, 5, 6(a) 7(a), 7b(1), 8, 9, 11, 13, 14, 16, 17, 18, 19 & 20 of Table A thereof. The field work was completed on May 19, 2021.

I hereby declare this map to be prepared in accordance with the Code of Practice of the New York State Association of Land Surveyors, adopted October, 1996 and revised through July 18, 1997.

Date of Plat or Map: 07/15/2021

WHITESTONE PROJECT NO.: GM1916427.000

Dear Mr. Manes:

Whitestone Associates, Inc. (Whitestone) is pleased to submit the attached *Report of Geotechnical Investigation* for the above-referenced project. The report presents the results of Whitestone's subsurface exploration and includes design recommendations for the foundations, slab, pavements, and related earthwork associated with the proposed warehouse development.

Whitestone appreciates the opportunity to be of continued service to WE Acquisitions, LLC. Should you have questions regarding the enclosed report, please contact us at (860) 726-7889.

Sincerely,

WHITESTONE ASSOCIATES, INC.

SECTION 1.0
Summary of Findings

Whitestone has completed an evaluation of the subsurface conditions at the site of the proposed warehouse development located on the south side of New York State Route 5S in the Town of Florida, Montgomery County, New York. Based on the April 25, 2019 *Overall Site Plan* (part of the set of *Site Development Plans*) prepared by Bohler Engineering MA, LLC (Bohler) of Albany, New York, the project consists of the construction of a one-story building with a footprint of approximately 1,000,000 square feet and associated paving, utilities, and landscaped areas. Significant cuts and fill will be required to develop the site, which has a grade change of about 100 feet across the site. Fill slopes up to about 65 feet in height are planned on the southern and eastern sides of the site. The fill slopes incorporate short sections of the retaining wall. Stormwater management areas are planned to the southeast, east, and southwest of the proposed building.

The fieldwork for the geotechnical investigations consisted of borings advanced by Dente Group (Dente) of Watervliet, New York and test pits monitored by Whitestone. Site subsurface conditions consisted of topsoil overlying natural glacial till, which is underlain by shallow shale bedrock. Groundwater was encountered at depths ranging from about one foot below the existing ground surface (fbgs) to 13.7 fbgs.

While the shale bedrock has a high propensity to swell, the amount of swelling that can occur, by converting pyrites into gypsum, is low. Chemical testing indicates the amount of pyrites available to cause swelling is only around one tenth of one percent.

The results of the investigation indicate that the proposed structure may be supported on conventional shallow foundations bearing on the natural glacial till or on glacial till placed over the shale bedrock. The results also indicate that the site is suitable for a ground-supported floor slab deriving support from the glacial till placed over the shale bedrock, or structural fill placed over these materials. Additionally, the site conditions support the use of typical pavement sections using standard New York State Department of Transportation (NYSDOT) specified materials.

The above summary is intended to provide an overview of the geotechnical findings and recommendations and is not fully developed. Greater detail is presented in the following sections. The entire report must be read for comprehensive understanding of the information contained herein.

SECTION 2.0
Introduction

2.1 AUTHORIZATION

Mr. Michael B. Manes, Director of Pre-Construction, of WE Acquisitions, LLC issued authorization to Whitestone to prepare a comprehensive geotechnical report for this site relevant to the construction of a proposed warehouse located on the south side of New York State Route 5S in the Town of Florida, Montgomery County, New York. The geotechnical report was prepared in general accordance with Whitestone's July 30, 2019 proposal.

2.2 PURPOSE

The comprehensive geotechnical report is intended to:

- ascertain the various soil profile components at test locations;
- review the results of laboratory testing;
- estimate the engineering characteristics of the proposed foundation bearing and subgrade materials;
- provide geotechnical criteria for use by the design engineers in preparing the foundation, floor slab, and pavement design;
- provide recommendations for required earthwork and subgrade preparation;
- record groundwater and/or bedrock levels (if encountered) at the time of the investigation and discuss the potential impact on the proposed construction; and
- recommend additional investigation and/or analysis, if warranted.

2.3 SCOPE

The scope of the exploration and analysis included the subsurface exploration, field testing and sampling, laboratory analysis, and a geotechnical engineering analysis and evaluation of the subsurface materials. This *Report of Geotechnical Investigation* is limited to addressing the site conditions as they relate to the physical support of the proposed construction. An environmental assessment was not part of the assignment.

2.3.1 Field Exploration

Field exploration at the project site consisted of 48 soil borings by Dente and eight test pits by Whitestone. The explorations subsequently were backfilled to the surface with excavated soils from the investigations. The locations of the soil borings and test pits are shown on the accompanying exploration location plans included as Figures 1a and 1b. *Records of Subsurface Exploration* are provided in Appendix A.

Test locations were based on project information provided at the time of the investigations. The subsurface tests were conducted in the presence of field engineers, who performed field tests, recorded visual classifications, and collected samples of the various strata encountered. Test locations were established in the field using normal taping procedures and estimated right angles. These locations are presumed to be accurate to the degree implied by the method used.

Soil borings and Standard Penetration Tests (SPTs) were conducted in general accordance with ASTM International (ASTM) designation D1586. The Standard Penetration Resistance value (N) can be used as an indicator of the consistency of fine-grained soils and the relative density of coarse-grained soils. The N-value for various soil types can be correlated with the engineering behavior of earthworks and foundations.

Groundwater level observations, where encountered, were recorded during and immediately following the completion of the testing operations within the soil borings. Seasonal variations, temperature effects, and recent rainfall conditions may influence the levels of the groundwater, and the observed levels will depend on the permeability of the soils. Groundwater elevations derived from sources other than seasonally observed groundwater monitoring wells may not be representative of true groundwater levels.

2.3.2 Laboratory Testing Program

In addition to the field investigation, a laboratory testing program was conducted to determine additional, pertinent engineering characteristics of representative samples of on-site soils. The laboratory testing program was performed in general accordance with applicable ASTM standard test methods and included physical testing of the proposed building foundation bearing stratum.

Physical/Textural Analysis: Representative samples of the site soils were subjected to a laboratory testing program that included moisture content determination (ASTM D2216) and washed gradation analysis (ASTM D422) in order to perform supplementary engineering soil classifications in general accordance with ASTM D2487. The soils tested were classified by the Unified Soil Classification System (USCS). The results of the laboratory testing program are summarized in the following table:

LABORATORY TESTING SUMMARY					
Boring	**Sample Number**	**Depth (fbgs)**	**Moisture Content (%)**	**Passing No. 200 Sieve (%)**	**USCS Classification**
B-1	S-3	4.0 - 6.0	13.0	49.6	SM
B-3	S-4	10.0 - 12.0	9.0	43.8	SM
B-10	S-3	5.0 - 7.0	12.0	47.4	SM

Whitestone sent bulk samples of the relatively unweathered shale bedrock recovered from the test pits to the MultiTest laboratory in Longueuil, Quebec, Canada, to perform the testing that included Swell Potential Petrographic Index (SPPI) testing. In developed portions of Quebec, there is a widespread problem with

damage to concrete structures from swelling of soils due to pyrite content. The SPPI standard rating system was developed to classify the swell potential of a geomaterial by using laboratory procedures to relate the presence of framboidal pyrite to swell potential. The samples of the shale bedrock from the Florida site had a high SPPI, ranging from 64 to 70. Accordingly, to investigate the amount of likely swell, a second phase of testing, which included chemical analysis for pyrites content, was performed. The results indicated that the pyrite equivalent was very low, ranging from 0.11 to 0.15 percent.

The engineering classifications are useful when considered in conjunction with the additional site data to estimate properties of the soil types encountered and to predict soil behavior under construction and service loads. Laboratory test results from the physical testing and the Quebec pyrites testing are provided in Appendix B.

SECTION 3.0
Site Description

3.1 LOCATION AND DESCRIPTION

The subject site is located on the southern side of NYS Route 5S, close to the intersection with Target Drive, in the Town of Florida, Montgomery County, New York, Latitude 42.9341 North, Longitude 74.2275 West. The 137.2-acre site, which is identified further as Section 55, Block 1, Lots 1.1, 35.12, 135.131, 35.141, 35.151, 35.161, 36 & 37 and Block 2, Lot 4.1, currently is primarily agricultural land.

The irregularly shaped site is bounded to the north by NYS Route 5S, to the east by Mead Road, to the south by Interstate 90, and to the west by a commercial building. Access to the site is from NYS Route 5S. The site of the proposed construction is shown on the *Exploration Plan* included as Figure 1a.

3.2 EXISTING CONDITIONS

Existing Development: The subject site is primarily agricultural land, with wooded portions and a couple of residences.

Topography: Based on a review of the USGS 7.5 Minute Series Amsterdam Quadrangle, New York (2016), the *Overall Grading & Drainage Plan* by Bohler, and Whitestone's visual observations, the site generally slopes down to the south from approximately 550 feet above National American Vertical Datum of 1988 (NAVD) to 450 feet above NAVD.

Utilities: The site is not currently serviced by underground utilities. The utility information contained in this report is presented for general discussion only and is not intended for construction purposes.

Site Drainage: Surface run-off will tend to flow to the south.

3.3 SITE GEOLOGY

According to the University of the State of New York, The State Education Department *Surficial Geologic Map of New York, Hudson-Mohawk Sheet* (1987), the site is underlain by glacial till. The University of the State of New York, The State Education Department *Geologic Map of New York, Hudson-Mohawk Sheet* (1970) indicates that the site is underlain, at shallow depth, by the Middle Ordovician-aged Canajoharie Shale, part of the Lorraine, Trenton, and Black River Groups. The Canajoharie Shale consists of black shale.

3.4 PROPOSED CONSTRUCTION

The aforementioned *Overall Site Plan* indicates that the project consists of the construction of a one-story building with a footprint of approximately 1,000,000 square feet and associated paving, utilities, and landscaped areas. Significant cuts and fill will be required to develop the site, which has a grade change of about 100 feet across the site. Fill slopes up to about 65 feet in height are planned on the southern and eastern sides of the site. The fill slopes incorporate short sections of the retaining wall. Stormwater management areas are planned to the southeast, east, and southwest of the proposed building.

Whitestone anticipates the proposed building will be a single-story, masonry and metal-framed structure constructed with a ground-supported concrete floor slab. Maximum column and wall loads are expected to be on the order of:

- column loads - 350.0 kips;
- load bearing walls - 5.0 kips per lineal foot; and
- floor slab loads - 150 pounds per square foot.

The scope of Whitestone's investigation and the professional advice contained in this report were generated based on the project details and loading noted herein. Revisions or additions to the design details enumerated in this report should be brought to the attention of Whitestone for additional evaluation as warranted.

SECTION 4.0
Subsurface Conditions

Details of the subsurface materials encountered during the site investigations are presented on the *Records of Subsurface Exploration* presented in Appendix A of this report. The subsurface soil and bedrock conditions encountered in the test locations consisted of the following generalized strata in order of increasing depth. The following section provides only a brief summary of subsurface soil conditions; the exploration logs have more detail.

4.1 SUBSURFACE SOIL CONDITIONS

Surface Cover Materials: The explorations typically encountered up to 17 inches of topsoil at the ground surface.

Glacial Till: Beneath the surface cover materials, the explorations encountered glacial till, typically consisting of brown, medium dense to dense (occasionally loose or very dense), silty sand with gravel (USCS: SM) to clayey sand with gravel (USCS: SC), cobbles and boulders. SPT N-values recorded within the glacial till were variable, ranging up to about 70 blows per foot.

Weathered Bedrock and Bedrock: Below the glacial till or surface cover materials, the explorations encountered black shale bedrock, the upper few feet of which were typically weathered. The explorations generally terminated in the shale bedrock.

4.2 GROUNDWATER

Groundwater was encountered during Whitestone's subsurface exploration activities at depths ranging from one fbgs to 13.7 fbgs. Additionally, static and perched/trapped water conditions generally will fluctuate seasonally and following periods of precipitation.

SECTION 5.0
Conclusions and Recommendations

5.1 GENERAL

Laboratory testing indicates that, while the shale bedrock has a high propensity to swell (SPPI in the high range), the amount of swelling that can occur, as determined by the percentage of framboidal pyrites available to be converted into the higher volume gypsum, is low. The results of the chemical testing indicate that the amount of pyrites available to cause the swelling is very limited, around one tenth of one percent. However, because of the high propensity of the shale to swell, Whitestone considers that certain basic precautions should be taken during construction, as discussed below.

The results of the investigation indicate that the structure may be supported on conventional shallow foundations bearing on properly inspected and approved glacial till or at least 12 inches of glacial till or other relatively impermeable fill placed over the undisturbed shale bedrock, and/or properly placed structural fill. The results of the investigation also indicate a ground-supported floor slab may derive support from properly inspected and approved glacial till or at least 12 inches of glacial till or other relatively impermeable fill placed over the undisturbed shale bedrock, and/or compacted structural fill. Additionally, the site conditions support the use of typical pavement sections using standard NYSDOT specified materials, however, at least 12 inches of glacial till or other relatively impermeable fill should be placed over exposed or crushed shale bedrock before placing the granular subbase for the pavement. Excavated shale bedrock should not be used as fill under and within 10 feet of the proposed building footprint.

5.2 SITE PREPARATION AND EARTHWORK

Surface Cover Stripping and Demolition: Prior to stripping operations, any underground utilities should be identified and secured. Any remaining existing buildings to be demolished should be removed from within and at least five feet beyond the limits of the proposed building and pavement areas. Existing structural elements, such as foundation walls, and concrete foundations, walls or slabs should be removed entirely. Pavements, vegetation, topsoil, and organic matter should also be removed from within and at least five feet beyond the limits of the proposed building footprint, as well as any other area that will require controlled structural fill placement. Tree/shrub removal should include the removal of stumps and root material, which may require excavation of more than the few inches of topsoil encountered in the explorations. The demolition contractor should be required to perform earthwork in accordance with the recommendations in this report, including backfilling any excavation, etc. with structural fill. Fill or backfill placed within the proposed structural areas during demolition operations should be placed as structural fill in accordance with Section 5.2 and 5.3 of this report.

Bedrock Excavation Quantities: Whitestone understands that Bohler will update their bedrock excavation quantities following receipt of this report. Because of the change of recommendations compared

with the Dente report, the bedrock excavation quantities will be significantly reduced. Whitestone should review this information when available.

Surface Preparation/Proofrolling: Before placing fill or subbase materials to raise or restore grades to the desired subgrade elevations, the existing exposed soils should be compacted to a firm surface with several passes in two perpendicular directions of a minimum 10-ton vibratory roller. The surface should then be proofrolled with a loaded tandem axle truck in the presence of the geotechnical engineer to help identify soft or loose pockets that may require removal and replacement or further investigation. Proofrolling should be performed after a suitable period of dry and non-freezing weather to reduce the likelihood of degrading an otherwise stable subgrade. Should construction be attempted in the winter or when temperatures are below freezing, Whitestone should be contacted for alternative surface preparation recommendations. Fill and backfill should be placed and compacted in accordance with Section 5.3.

Weather Performance Criteria: Because the natural glacial till and shale bedrock are moisture sensitive and will soften when exposed to water, every effort should be made to maintain drainage of surface water runoff away from construction areas by grading and limiting the exposure of excavations and prepared subgrades to rainfall. Accordingly, excavation and fill placement procedures should be performed during favorable weather conditions. Overexcavation of saturated soils and replacement with controlled structural fill per Section 5.3 of this report may be required prior to resuming work on disturbed subgrade soils. Alternatively, lime or Portland cement stabilization may be selectively be used to address the moisture sensitive soil and bedrock.

Subgrade Protection and Inspection: Glacial till or relatively impermeable imported fill should be placed over the bedrock immediately after excavation. Excavations in bedrock should not be left open to the elements overnight or over a weekend. Because the natural glacial till and shale bedrock are moisture sensitive and will soften when exposed to water, every effort should be made to reduce disturbance of the on-site soils by construction traffic and surface runoff. The on-site materials will deteriorate when subjected to repeated construction traffic and/or inclement weather, which would require removal and replacement. These materials also may require discing, drying, and aeration during wet periods. The contractor should be responsible for protection of subgrades and minimization of exposure of the site materials to precipitation by covering stockpiles and subgrades with plastic and preventing ponding of water by sealing subgrades before precipitation events and grading the site to allow proper drainage of surface water. All rutting from construction equipment should be removed prior to any forecasted or actual precipitation. The services of the geotechnical engineer should be retained to observe soils conditions during construction and review the suitability of prepared foundation subgrades for support of design loads.

5.3 STRUCTURAL FILL AND BACKFILL

Imported Fill Material: Generally, imported material placed as structural fill or backfill to restore design grades should consist of clean, relatively well graded sand or gravel with a maximum particle size of three inches and up to 15 percent of material, by weight, finer than a #200 sieve. The material should be free of clay lumps, organics, and deleterious material. However, if there is insufficient on-site glacial till for the 12 inches of relatively impermeable fill to be placed over the shale bedrock, the imported fill should closely match the glacial till, which has around 40 percent of material finer than a #200 sieve. Any imported structural fill material should be approved by a qualified geotechnical engineer prior to delivery to the site.

On-Site Material/Reuse: Whitestone anticipates that the glacial till will be suitable for selective reuse as structural backfill materials during favorable weather conditions, provided that any deleterious material and objectionable debris encountered are removed, pieces larger than three inches in diameter are removed or crushed, and moisture contents are controlled within three percent of the optimum moisture content. However, the glacial till has a high fines content. Prior to reuse, drying may be necessary or mixing with more granular materials. In addition, on-site glacial till reuse should not be attempted during inclement or freezing weather, or in damp conditions. Reuse of the glacial till will be contingent on careful inspection by the owner's geotechnical engineer during construction. The site soils should be properly compacted and evaluated during the construction phase as described herein.

Whitestone recommends that the excavated shale not be used as structural fill within the proposed building footprint or within 10 feet of the footprint. The excavated shale may be crushed to a maximum particle size of three inches and used elsewhere on the site under paved and landscaped areas. A geotextile separation fabric should be placed between crushed bedrock and soils with an elevated fines content, as specified in Section 5.7. Reuse of the crushed shale should not be attempted during inclement or freezing weather, or in damp conditions.

The site contractor should be required to cover stockpiled soils, seal subgrades each day and provide proper surface drainage during forecasted wet weather. Alternatively, imported materials may be required to expedite earthwork operations, especially if the construction schedule or the site area restricts moisture control operations, such as spreading and air drying the soil.

Compaction and Placement Requirements: Fill and backfill should be placed in maximum eight-inch loose lifts and compacted using a vibratory drum roller during mass grading activities or a small hand-held vibratory compactor within excavations. Structural fill and backfill placed within the structure pads and non-structure areas should be compacted to at least 95 percent of the maximum dry density within three percent of the optimum moisture content, as determined by ASTM D1557 (Modified Proctor).

Structural Fill Testing: Samples of imported fill materials or on-site material proposed for re-use as structural fill or backfill should be submitted to the owner's geotechnical engineer for analysis and approval at least one week prior to its use. The placement of fill and backfill should be monitored by a qualified engineering technician, so that the specified material and lift thicknesses are properly installed. A sufficient

number of in-place density tests should be performed to check that the specified compaction is achieved throughout the height of the fill or backfill.

5.4 GROUNDWATER CONTROL/STORMWATER MANAGEMENT

Groundwater, probably perched, was encountered during the fieldwork only in a few explorations at depths varying from one fbgs to 13.7 fbgs. However, cuts are planned, which may extend below the groundwater table. Whitestone anticipates the need for construction dewatering and permanent groundwater control, such as edge drains, foundation perimeter drains, and intermittent under-pavement drains. Additionally, trapped/perched water may be encountered within the fine-grained glacial till and/or at the glacial till/shale bedrock interface, especially following precipitation events. As such, construction phase dewatering of static and trapped/perched water through the use of gravity fed sump pumps may be required during conventional spread foundation excavation activities for this site.

Since excessive amounts of perched groundwater may accumulate during periods of wet weather, Whitestone recommends that foundation construction occur during periods of relatively dry weather. Every effort must be made to maintain drainage of surface water runoff away from construction areas by grading and limiting the exposure of foundation areas to precipitation.

Whitestone has reviewed the locations of the stormwater management (SWM) basins on the Bohler *Overall Grading & Drainage Plan*. The locations are downgradient of the structure, thus reducing the risk of introducing moisture into the crushed shale fill. Whitestone understands that Bohler has not yet completed the design of the SWM basins. Whitestone recommends that, in the absence of glacial till to provide an adequate impervious layer in the basins, an impermeable membrane should be incorporated into the basin liner to prevent water contacting the crushed shale fill. The final design of the SWM basins and other drainage measures should be reviewed by Whitestone.

5.5 FOUNDATIONS

Shallow Foundation Design Criteria: Whitestone considers that the proposed structure may be supported on conventional shallow foundations bearing on properly inspected and approved glacial till or at least 12 inches of glacial till or other relatively impermeable fill placed over the undisturbed shale bedrock, and/or properly placed structural fill, provided these materials are properly evaluated, in accordance with Sections 5.2, 5.3, and 5.12 of this report. Foundations bearing within these materials may be designed using a maximum net allowable bearing pressure of 4,500 pounds per square foot.

Spread footings should not be placed directly on the shale bedrock. The bedrock should be covered with at least 12 inches of compacted glacial till or other suitable fine-grained, relatively impermeable material, prior to constructing formwork. The soil cover should be placed over the bedrock immediately after excavation. Excavations in bedrock should not be left open to the elements overnight or over a weekend. In addition to mitigating swell, the placement of soil over bedrock will reduce the differential settlement of footings placed across materials of varying stiffness, such as the glacial till and bedrock. The soil layer creates a transition zone to reduce the effect of the change in support characteristics.

Foundation subgrades should be reviewed by the geotechnical engineer. Regardless of loading conditions, new foundations should be sized no less than minimum dimensions of 24 inches for continuous wall footings and 36 inches for isolated column footings. A perimeter foundation drain should be installed at or below the underside of footing level.

Footings subject to lateral loads and/or overturning should be designed so that the maximum toe pressure due to the combined effect of vertical loads and overturning moment does not exceed the recommended maximum allowable net bearing pressure. In addition, positive contact pressure should be maintained throughout the base of the footings such that no uplift or tension exists between the base of the footings and the supporting soil. Uplift loads should be resisted by the weight of the concrete. Side friction should be neglected when proportioning the footings so that lateral resistance should be provided by friction resistance at the base of the footings. An allowable coefficient of friction against sliding of 0.35 is recommended for use in the design of the foundations bearing within the existing site soils or imported structural fill soils.

Foundation Inspection/Overexcavation Criteria: Whitestone recommends that the suitability of the bearing materials at the footing bottoms be reviewed by Whitestone immediately prior to placing concrete for the footings. In the event that areas of unsuitable materials are encountered, additional overexcavation and replacement of the materials may be necessary to provide a suitable footing subgrade. Any overexcavation to be restored with structural fill will need to extend at least one foot laterally beyond footing edges for each vertical foot of overexcavation. Lateral overexcavation may be eliminated if grades are restored with lean concrete.

Settlement: Whitestone estimates post-construction settlements of proposed foundations on the order of less than one inch, if the recommendations outlined in this summary are properly implemented. Differential settlement of spread foundations should be less than one half inch.

Frost Coverage: Footings subject to frost action should be placed at least 48 inches below adjacent exterior grades, or the depth required by local building codes, to provide protection from frost penetration. Interior footings not subject to frost action may be placed at a minimum depth of 18 inches below the floor slab subgrade.

5.6 FLOOR SLAB

Following surficial compaction and proofrolling to densify any upper loose zones, Whitestone anticipates that the properly inspected and approved glacial till and/or compacted structural fill will be suitable for

support of the proposed floor slab, provided these materials are properly evaluated, compacted, and proofrolled during favorable weather conditions in accordance with Sections 5.2, 5.3, and 5.12 of this report. In a similar manner to spread footings, as described above, the granular base for the floor slab should not be placed directly on the shale bedrock. The bedrock should be covered with at least 12 inches of compacted glacial till or other suitable fine-grained, relatively impermeable material, prior to placing the granular base layer. The soil should be placed over the bedrock immediately after excavation. Exposed bedrock under slab areas should not be left open to the elements overnight or over a weekend. Areas that are, or become, softened or disturbed as a result of wetting and/or repeated exposure to construction traffic should be removed and replaced with compacted structural fill. The properly prepared on-site soils are expected to yield a minimum subgrade modulus (k) of 200 psi/in.

A minimum six-inch thick layer of NYSDOT 733-04 Subbase Course, Type 2 (or approved equivalent) should be placed below the floor slab to provide a uniform subbase. A moisture vapor barrier should be installed beneath the floor slab in accordance with flooring manufacturer's recommendations. A moisture vapor barrier should also be installed if the floor supports moisture-sensitive equipment.

5.7 PAVEMENT DESIGN CRITERIA

General:

Whitestone anticipates that the properly inspected and approved natural site soils or compacted structural fill placed to raise grade are expected to be suitable for support of the proposed pavements, provided these materials are properly evaluated, compacted, and proofrolled during favorable weather conditions in accordance with Sections 5.2, 5.3, and 5.12 of this report. Where the pavement is placed over shale bedrock or crushed shale fill, the pavement granular subbase should be underlain by at least 12 inches of compacted glacial till or other suitable fine-grained, relatively impermeable material. A geotextile separation fabric (Mirafi 140N, or equivalent) should be placed over the crushed shale fill before placing the glacial till. Alternatively, in place of the geotextile separation fabric, a 12-inch layer of appropriately graded filter stone should be placed over the crushed shale fill to reduce the likelihood of the fines from the glacial till migrating into the crushed shale fill. To the extent practical, the crushed shale bedrock should be placed in relatively consistent thicknesses to reduce the possible differential movement from potential swelling. As a guide, the thickness of the placed crushed shale layer should not vary by more than about one foot over 50 lineal feet

Design Criteria: A California Bearing Ratio value of 8.0 has been assigned to the properly prepared subgrade soils for pavement design purposes. This value was correlated with pertinent soil support values and assumed traffic loads to prepare flexible and rigid pavement designs per the AASHTO *Guide for the Design of Pavement Structures*.

Design traffic loads were assumed based on typical volumes for similar facilities and correlated with 18-kip equivalent single axle loads (ESAL) for a 20-year life. Estimated maximum pavement loads of 10,000 ESALs and 4,000,000 ESALs were used for the standard-duty and heavy-duty pavement areas, respectively. These values assume the heavier truck traffic will be designated to the main drive/access lanes.

Pavement Sections: Pavement components should meet material specifications from NYSDOT *Standard Specifications* specified below. The recommended flexible pavement sections are tabulated below:

FLEXIBLE PAVEMENT SECTIONS			
Layer	**Material**	**Standard-Duty Thickness (Inches)**	**Heavy-Duty Thickness (Inches)**
Asphalt Top Course	NYSDOT 12.5 mm F3 Top Course HMA, 70 Series Compaction (Superpave); PG64S-22	1.5	1.5
Asphalt Binder Course	NYSDOT 25 mm F9 Binder Course HMA, 70 Series Compaction (Superpave); PG64S-22	1.5	4.5
Granular Subbase	NYSDOT Type 2 Subbase	12.0	18.0 [1]

[1] Mirafi 500X or equivalent should be placed below the granular subbase where the glacial till subgrade is unstable, as required and as directed by the site geotechnical engineer. Tensar TriAx TX130S geogrid or equivalent may also need to be incorporated within the granular subbase if the glacial till subgrade becomes unstable.

A rigid concrete pavement should be used to provide suitable support at areas of high traffic or severe turns. The recommended rigid pavement is presented below in tabular format:

RIGID PAVEMENT SECTION		
Layer	**Material**	**Thickness (Inches)**
Surface	4,000 psi Air-Entrained Concrete	10.0 [1]
Granular Subbase	NYSDOT Type 2 Subbase	18.0

[1] The outer edges of concrete pavement are susceptible to damage as trucks move from rigid pavement to adjacent flexible pavement. Therefore, the thickness at the outer two feet of the rigid concrete pavement should be 16 inches.

Additional Design Considerations: The pavement section thickness designs presented in this summary are based on the design parameters detailed herein and are contingent on proper construction, inspection, and maintenance. Additional pavement thickness may be required by local code. The designs are contingent on achieving the minimum soil support value in the field. To accomplish this requirement, subgrade soil and supporting fill or backfill must be placed, compacted, and evaluated by Whitestone. Proper drainage should be provided for the pavement structure, including appropriate grading and surface water control, edge (interceptor) drains on the higher side(s) of the site, underdrains at regular intervals, and finger drains at catch basins. Edge drains, underdrains, and finger drains at catch basins should be designed and installed to manage groundwater and reduce the likelihood of water reaching the underlying crushed shale fill.

The performance of the pavement also will depend on the quality of materials and workmanship. Whitestone recommends that NYSDOT standards for materials, workmanship, and maintenance be applied to this site. Project specifications should include verifying that the installed asphaltic concrete material composition is within tolerance for the specified materials and that the percentage of air voids of the installed pavement is within specified ranges for the respective materials. Rigid concrete pavements should

be suitably air-entrained, jointed, and reinforced in general accordance with ACI 330R-08 *Guide for the Design and Construction of Concrete Parking Lots*.

Regular pavement maintenance, including crack filling, will be mandatory, so that runoff does not enter the crushed shale fill through the pavement.

5.8 RETAINING WALLS/LATERAL EARTH PRESSURES

Short sections of retaining walls are indicated where the proposed slopes cannot be extended. The following parameters may be used for design of the proposed site retaining walls, any below-grade walls, and other structures reliant on granular materials to provide adequate drainage.

Lateral Earth Pressures: Retaining/below-grade walls should be capable of withstanding active and at-rest earth pressures. With an active earth pressure coefficient (K_a) of 0.33 and assuming a level backfill and an assumed maximum backfill soil unit weight of 140 pounds per cubic foot (pcf), an equivalent fluid pressure of 46 psf per foot of wall height should be used in design of retaining/below-grade walls which are free to rotate.

Retaining/below-grade walls and wall corners typically are restrained from lateral movement and should be designed using at-rest earth pressures. A coefficient of at-rest earth pressure (K_o) of 0.5, for a level backfill, is recommended for retaining/below-grade walls designed to resist at-rest earth pressures, which assume no lateral movement. With an assumed maximum total unit weight of backfill of approximately 140 pcf, an equivalent fluid pressure of 70 pounds per square foot per foot of wall height should be used in design of restrained retaining/below-grade wall and wall corners. A coefficient of friction of 0.4 against sliding can be used for concrete on the existing site soils. Additional lateral earth pressures from a sloped backfill or any temporary or long term surcharge loads also should be included in the design. Retaining wall design should include a global stability analysis.

Backfill Criteria: Whitestone recommends that granular soils be used to backfill behind retaining walls. The granular backfill materials should consist of clean, relatively well graded sand or gravel with a maximum particle size of three inches and five percent to 15 percent of material finer than a #200 U.S. Standard sieve.

Whitestone recommends that backfill directly behind any walls be compacted with light, hand-held compactors. Heavy compactors and grading equipment should not be allowed to operate within a zone of influence measured at a 45-degree angle from the base of the walls during backfilling to avoid developing excessive temporary or long-term lateral soil pressures.

Wall Drainage: Positive drainage should be provided at the base of the below-grade walls. Where wall drainage is not provided, the wall should be designed to withstand full hydrostatic pressure.

Whitestone should be notified if any other retaining structures or design considerations requiring lateral earth pressure estimations are proposed. Specific recommendations for temporary retaining structures are beyond Whitestone's scope of work.

5.9 SLOPE STABILITY

Grading will include fill slopes up to about 65 feet in height on the southern and eastern sides of the site. Whitestone's exploration did not include a detailed analysis of slope stability for any temporary or permanent condition. Based upon common local practice and our experience with stable soil slopes, we recommend permanent soil slopes no steeper than 3:1 (horizontal:vertical). Should steeper slopes be considered, riprap covering would likely be required for long term stability and erosion control. Horizontal berms should be incorporated into the slopes at regular vertical intervals of around 20 feet.

Temporary slopes should be regularly evaluated for signs of movement or unsafe conditions. The site soils and crushed bedrock are prone to erosion by precipitation and runoff. Slopes should be covered for protection from rain. Surface runoff should be diverted away from the slopes. For erosion protection, a protective cover of grass or other vegetation should be established on permanent soil slopes as soon as possible. Erosion control matting would provide protection until vegetation is fully established.

5.10 SEISMIC AND LIQUEFACTION CONSIDERATIONS

The subsurface conditions are most consistent with a Site Class C, as defined by the *State of New York Building Code*. The site soils are not susceptible to earthquake induced liquefaction.

5.11 EXCAVATIONS

The natural glacial till encountered during the investigations typically is, at a minimum, consistent with Type C Soil Conditions as defined by 29 CFR Part 1926 (OSHA), which require a maximum unbraced excavation angle of 1.5:1 (horizontal:vertical). Actual conditions encountered during construction should be evaluated by a competent person (as defined by OSHA), so that safe excavation methods and/or shoring and bracing requirements are implemented. Competent bedrock may be excavated at an angle of 1:6 (horizontal:vertical). A steeper excavation angle in the bedrock may be feasible, if the exposed bedrock is reviewed by a professional engineer or geologist.

5.12 SUPPLEMENTAL POST INVESTIGATION SERVICES

Demolition and Construction Inspection and Monitoring: The owner's geotechnical engineer with specific knowledge of the site subsurface conditions and design intent should perform inspection, testing, and consultation during construction, as described in previous sections of this report. Monitoring and testing should be performed to check that existing structures are properly demolished, any unsuitable material is over excavated below foundations and slab where necessary, and suitable materials are used for

controlled fill. Monitoring and testing should also be performed to check that the existing surface cover materials are properly removed, the foundation elements of the existing buildings are removed, the handling of excavated shale bedrock is consistent with the recommendations in this report, and suitable materials used for controlled fill are properly placed and compacted over suitable subgrade soils. Placement of fill should be witnessed and documented by the owner's geotechnical engineer.

SECTION 6.0
General Comments

Supplemental recommendations may be required upon finalization of construction plans or if significant changes are made in the characteristics or location of the proposed structure. Soil/rock bearing conditions should be checked at the appropriate time for consistency with those conditions encountered during Whitestone's geotechnical investigation.

The recommendations presented herein should be utilized by a qualified engineer in preparing the project plans and specifications. The engineer should consider these recommendations as minimum physical standards which may be superseded by local and regional building codes and structural considerations. These recommendations are prepared for the sole use of WE Acquisitions, LLC for the specific project detailed and should not be used by any third party. These recommendations are relevant to the design phase and should not be substituted for construction specifications.

The possibility exists that conditions between borings may differ from those at specific test locations, and conditions may not be as anticipated by the designers or contractors. In addition, the construction process may alter soil and rock conditions. Therefore, experienced geotechnical personnel should observe and document the construction procedures used and the conditions encountered.

Whitestone assumes that a qualified contractor will be employed to perform the construction work, and that the contractor will be required to exercise care to ensure all excavations are performed in accordance with applicable regulations and good practice. Particular attention should be paid to avoiding damaging or undermining adjacent properties and maintaining slope stability.

Whitestone recommends that the services of the geotechnical engineer be engaged to test and evaluate the soils in the footing excavations prior to concreting in order to determine that the soils will support the bearing pressures. Monitoring and testing also should be performed to verify that suitable materials are used for controlled fills and that they are properly placed and compacted over suitable subgrade soils.

The exploration and analysis of the foundation conditions reported herein are considered sufficient in detail and scope to form a reasonable basis for the foundation design. The recommendations submitted for the proposed construction are based on the available soil information and the design details furnished by WE Acquisitions, LLC and Bohler Engineering MA, LLC. Deviations from the noted subsurface conditions encountered during construction should be brought to the attention of the geotechnical engineer.

The geotechnical engineer warrants that the findings, recommendations, specifications, or professional advice contained herein have been promulgated after being prepared in accordance with generally accepted professional engineering practice in the fields of foundation engineering, soil mechanics, and engineering geology. No other warranties, express or implied, are made.

GEOTECHNICAL TERMS AND SYMBOLS

SAMPLE IDENTIFICATION

The Unified Soil Classification System is used to identify the soil unless otherwise noted.

SOIL PROPERTY SYMBOLS

N:	Standard Penetration Value: Blows per ft. of a 140 lb. hammer falling 30" on a 2" O.D. split-spoon.
Qu:	Unconfined compressive strength, TSF.
Qp:	Penetrometer value, unconfined compressive strength, TSF.
Mc:	Moisture content, %.
LL:	Liquid limit, %.
PI:	Plasticity index, %.
δd:	Natural dry density, PCF.
▼:	Apparent groundwater level at time noted after completion of boring.

DRILLING AND SAMPLING SYMBOLS

NE:	Not Encountered (Groundwater was not encountered).
SS:	Split-Spoon - 1 ⅜" I.D., 2" O.D., except where noted.
ST:	Shelby Tube - 3" O.D., except where noted.
AU:	Auger Sample.
OB:	Diamond Bit.
CB:	Carbide Bit
WS:	Washed Sample.

RELATIVE DENSITY AND CONSISTENCY CLASSIFICATION

Term (Non-Cohesive Soils)	Standard Penetration Resistance
Very Loose	0-4
Loose	4-10
Medium Dense	10-30
Dense	30-50
Very Dense	Over 50

Term (Cohesive Soils)	Qu (TSF)
Very Soft	0 - 0.25
Soft	0.25 - 0.50
Firm (Medium)	0.50 - 1.00
Stiff	1.00 - 2.00
Very Stiff	2.00 - 4.00
Hard	4.00+

Exit 27 Warehouse
Route 5S Town of Florida, NY
SEQR Full Environmental Assessment Form – Part 3

PART 3

EVALUATION OF THE IMPORTANCE OF IMPACTS

Responsibility of the Town of Florida Planning Board as Lead Agency

Part 3 must be prepared if one or more impact(s) is considered to be potentially large, even if the impact(s) may be mitigated.

Instructions

Discuss the following for each impact identified in column 2 of Part 2:

1. Briefly describe the impact.

2. Describe how the impact could be mitigated or reduced to a small to moderate impact by project change(s).

3. Based on the information available, decide if it is reasonable to conclude that this impact is important.

To answer the question of importance, consider:

- The probability of the impact occurring
- The duration of the impact
- Its irreversibility, including permanently lost resources of value
- Whether the impact can or will be controlled
- The regional consequence of the impact
- Its potential divergence from local needs and goals
- Whether known objections to the project relate to this impact

Attachment 9 – Traffic Impact Study

Part 3 - Expanded Environmental Assessment

1. Project Description

1.1 Proposed Development

WE Acquisitions, LLC is proposing to construct a 1,000,000 square foot warehouse storage facility on approximately 138 +/- acres along NYS Route 5S in the Town of Florida, Montgomery County, New York (hereinafter referred to as "project site").

The project includes associated on-site roadways, parking, utility infrastructure, landscaping, and stormwater management facilities. There will be two (2) driveway entrances from NYS Route 5S; one dedicated driveway for employees and one for trucks.

A security gate with a guard house will be provided at the truck entrance. Approximately 245 parking spaces will be provided for employees and approximately 850 parking spaces will be provided for truck trailers, off which 244 are loading docks.

There will be two employee shifts per day, with the facility operating Monday through Saturday. The day shift will be from 7:00 am to 5:30 pm and the night shift from 6:30 am to 5:00 pm. The project site is currently zoned C-2 Commercial, with "warehouse/storage" listed as requiring a special use permit.

The proposed facility will be constructed in its entirely in one phase, with an 18-month construction schedule.

Refer to Attachment 2 for Preliminary Building/Site Perspectives and Attachment 3 – Preliminary Site Development Plans for further information on the project.

1.2 Project Site

The project site is bounded by NY-5S to the north, Mead Road to the southeast, a working farm and the New York State Thruway (I-90) to the south, and the property of Lott Holding Corp., 1785 NY Route 5, to the west. Refer to Attachment 4 – Existing Conditions Plan for further information.

The site currently consists of eleven (11) separate parcels, which will be consolidated/subdivided into three parcels, of 138, 3.7 and 18.6 acres. The two smaller parcels will be retained by their current owner and continue to be used for agriculture. Refer to Attachment 5 for the Preliminary Subdivision and Lot Consolidation Plans for further information.

Presently, the project site consists of two residential properties including houses, garages, and outbuildings (both properties to the north along Route 5S), a wooden farm stand building and associated small metal shed (central-north, along Route 5S), and a metal barn/shed structure to the east, off of Mead Rd.

Several portions of the project site consist of brush and forested areas, and the remainder consists of active farmed fields. The westernmost boundary lies along the edge of a graveled parking lot, part of which appears to extend onto the project site.

An unnamed tributary of the Chuctanunda Creek runs along the southeastern boundary and through the southern portion of the project site. A natural gas transmission line crosses the project site in a north-south direction near its eastern limit. The line is reputed to be 10" and installed during the 1970's

1.3 Project Implementation

Implementation of the project involves several approvals including the following:

- Coordinated SEQRA review by the Town of Florida Planning Board (Lead Agency), as the action is considered to be a "Type I" action.
- Site Plan, Special Use Permit and Subdivision review and approval by the Town of Florida Planning Board.
- NYSDOT review and approval of the Traffic Impact Study.
- NYSDOT approval of two (2) new curb cuts onto NYS Route 5S.
- Town approval of water and sewer connection permits
- Montgomery County Planning Board Board 239M Review
- NYS Office of Parks Recreation and Historic Preservation Approval of Data Recovery Plan (DRP)
- Approval and acceptance of the Stormwater Pollution Prevention Plan (SWPPP), which is to be prepared in compliance with the NYSDEC General Permit for Stormwater Discharges from Construction Activity (GP-0-15-002), as well as approval for disturbing more than five (5) acres of land at one time.
- Review and approval of Section 401 Water Quality Certificate by NYSDEC and Individual Permit from US Army Corps of Engineers for wetland disturbance.

2. Impact Analysis and Mitigation Measures

2.1 Impact on Land

In general, the project site surface elevations slope downward from north to south and west to east between elevations 550 to 450 feet. The change in grades across the site will result in substantial cuts and fill to develop the site.

Based on preliminary grading, fill slopes up to about 65 feet in height are planned on the southern and eastern sides of the site. The fill slopes incorporate short sections of the retaining wall. Furthermore, stormwater management areas are planned to the southeast, east, and southwest of the proposed building.

To better define subsurface conditions, the applicant undertook a geotechnical investigation over the course of the spring and summer 2019. The fieldwork consisted of a series of borings and test pits scattered across the area where the proposed developed portions of the site.

Site subsurface conditions consisted of topsoil overlying natural glacial till, which is underlain by shallow shale bedrock. Generally found at depths ranging from 2 to 20 feet. Groundwater was encountered at depths ranging from about 1 to 13'.

The results of the investigation indicate that the proposed structure may be supported on conventional shallow foundations bearing on the natural glacial till or on glacial till placed over the shale bedrock. The results also indicate that the site is suitable for a ground-supported floor slab deriving support from the glacial till placed over the shale bedrock, or structural fill placed over these materials. Additionally, the site conditions support the use of typical pavement sections using standard New York State Department of Transportation (NYSDOT) specified materials.

The shallow bedrock will be removed by a combination ripping via a large track mounted backhoe and controlled blasting. Where blasting is determined to be necessary, the following protocol would be used:

- Blasting operation will be monitored by a seismologist using a seismograph
- "Peak Particle Velocity" emanating from any blast will be restricted to 2.0 in/sec
- Each blast will be monitored to ensure that this criterion is not exceeded.

The U.S. Bureau of Mines [Nicholas et al (1971)] has established a vibrational threshold of 2.0 in/sec. This threshold has been used successfully in the industry. Each blast would be monitored independently to ensure that this threshold is not exceeded. The monitoring results would be provided to the blasting contractor as soon as possible so that the blasting program can be modified if necessary.

A minimum of four monitoring points would be established, to the north, east, south and west of the planned blast area. The seismograph sensors would be placed near the closest structure and at any structures identified during the pre-blast survey that are considered to be susceptible to vibration damage.

Prior to the start of any construction, a Blasting Management Plan would be prepared in accordance with the applicable State regulations and the Explosive Materials Code, NFPA No. 495, National Fire Prevention Association. Additionally, all blasting would adhere to the provisions of 29 CFR Ch. XVII Section 1910.109 for explosives and blasting agents.

Not more than 30 days or less than 72 hours prior to the intended blasting, a notice would be sent to the owner or owners of any parcel of property immediately within a 500 foot radius of the blast area and the building inspector.

A contact person will be established and named in this notice to respond to all concerns raised by nearby residents during the blasting phase of the project. The contact person is to respond to any inquiries within 24 hours.

Prior to any blasting work being done, a licensed professional engineer will to be retained to perform a detailed pre-blast survey of existing structures located within 500 feet of the planned blast area. A copy of all reports prepared by the licensed engineer will be submitted to the Building Inspector.

2.2 Impacts on Surface Water

Wetlands: There is no New York State Department of Environmental Conservation (NYSDEC) regulated wetland or watercourses with the project site. Chuctanunda Creek, located along the southern edge of the

project site is identified as Class "C" and, therefore, is not regulated by the NYSDEC under Article 15 Protection of Waters.

In May 2019, Ecological Solutions, LLC completed a wetland delineation of the project site in accordance with the Army Corps of Engineers (USACE) Wetlands Delineation Manual (January 1987), Routine Determination Method and Northcentral/Northeast supplement. Federally regulated wetlands were delineated based upon the identification of the three mandatory criteria for wetland determination as outlined in the 1987 Federal Manual and supplement: dominant hydrophytic vegetation, hydric soils, and evidence of wetland hydrology.

The Routine Methodology procedure for wetland determination was used. Several transects consisting of sample points were walked. Dominant vegetation around each sample point was identified and its percent cover quantified. The areas were checked in detail for the presence of wetland hydrologic indicators. Soil profiles were then observed and characterized at each point.

The detailed field investigation included:

- Identification of vegetation species to determine whether there was a dominance of hydrophytic plants and areas containing transitional but primarily wetland-oriented species.

- Determination of soil features for hydric (poorly and very poorly drained) natural soils.

- Observation of site features displaying evidence of wetland hydrology based on the presence of inundated areas, apparent high seasonal water tables, and evidence of saturation within 12 inches of the surface (considered the root zone) during sufficient periods during the growing season to provide for anaerobic/hydric soil conditions.

Based on observed field conditions the federal wetland/waters of the US located on the site are shown on Attachment 4 and confirmed by the US Army Corps of Engineer as part of a June 25, 2019 field visit. Based on the delineation, the project site includes several separate wetland systems totaling approximately 12.6 acres.

The project is expected to impact approximately 6.5 acres of wetlands that are located along northwest corner of the site along Route 5S. This wetland area is mainly abandoned agricultural field and lawn area that consists of wetland meadow and shrub dominated wetland.

Proposed impacts to the wetland areas will require an Individual Permit from the USACE and a Section 401 Water Quality Certification from the NYSDEC. The wetland impacts that cannot be avoided will be minimized to the maximum extent practicable. It is expected that unavoidable wetland impacts will be mitigated through a combination of onsite creation and purchase of wetland credits.

Wetland creation is expected to be required at a ratio of 1.5 acres of impact for each acre impacted, which would equate to the project creating approximately nine (9) acres of wetlands. Approximately 3 acres will be created on site with the balance of 6 acres mitigated through the purchase of credits from the Wetland Trust.

The Wetland Trust (TWT) is a 501C (3) not-for-profit New York Corporation that manages in-lieu fee program sells wetland mitigation credits for permitted wetland impacts throughout much of New York State. TWT presently owns 26 properties covering 1,600 wetland acres.

Stormwater Management: A Stormwater Pollution Prevention Plan (SWPPP), which includes a Stormwater Management Plan has been prepared. The stormwater management plan includes an analysis of the existing and proposed hydrology and hydraulics to ensure that the proposed development does not significantly affect the environment. The results of the report are consistent with a site that can support the proposed development.

Although the project will alter the existing site topography, the existing drainage pattern will be maintained on the north and south sides of the property. There are three (3) discharge points (DP) where peak stormwater runoff is evaluated for both existing and proposed conditions. DP-1 is located in southeast corner of the site; DP - 2 is located in the northwest corner of the site, and DP-3 is located in the northeast corner of the site.

If untreated, the construction of the building and paved areas would increase the rate and volume of stormwater run-off. Therefore, the increase in run-off will be mitigated by the construction of stormwater management facilities designed to temporarily detain stormwater run-off during storm events and slowly release stormwater after the storm event. These facilities are designed in accordance with the NYSDEC Stormwater Design Manual and consist of sedimentation basins and bioretention for treatment prior to discharging into detention basins that will provide stormwater detention and water quality treatment.

Stormwater run-off from the building and paved areas will be collected in a series of catch basins and directed through a piping network to the stormwater management facilities. The stormwater bioretention areas will be sized to mitigate the Water Quality Volume (WQv), and the Runoff Reduction Volume (RRv). Detention basins will mitigate the Channel Protection Volume (CPv), the Overbank Flood (Qp), and the Extreme Storm (Qf). Each of these is addressed below:

- Water Quality Volume: The required WQv is provided in multiple bioretention basins.
- Runoff Reduction Volume: The RRv is achieved by filtering a substantial portion of the run-off to meet the minimum RRv requirement.
- Channel Protection Volume: The CPv requires that a minimum of 24-hour detention be provided for the 1-year, 24-hour storm event. This requirement is met since the detention basins will control the peak discharge from the 10 year storm to the 10-year predevelopment rates.
- Overbank Flood: The Qp requires that the there be no net increase in peak runoff for the 10- year, 24 hour storm event. This requirement is met since the detention basins will control the peak discharge from the 100-year storm to rates less than the 100-year predevelopment rates.
- Extreme Storm: The Qf requires that the there be no net increase in peak runoff for the 100-year, 24 hour storm event. This requirement is met since the detention basins will control the peak discharge from the 100-year storm to rates less than the 100-year predevelopment rates.

This project will be required to comply with the State Pollutant Discharge Elimination System (SPDES) Phase II General Permit for Stormwater Discharges from Construction Activities (GP-0-15-002). To that

end, the project will incorporate Best Management Practices (BMPs) to ensure that water quality on site will be protected. BMPs to be employed will, at a minimum, include:

- Temporary Erosion and Sediment Control Measures:
  - Silt fencing placed around construction areas prior to grading activities;
  - Diversion Channels to prevent runoff from leaving the site
  - Land clearing activities shall be done only in areas where earthwork will be performed and shall progress as earthwork is needed;
  - Permanent seeding and planting of all unpaved areas using the hydro-mulching grass seeding technique;
  - Mulching exposed areas, where specified;
  - Temporary seeding of all unpaved areas using the hydro-mulching grass seeding technique within 14 days of disturbance;
  - Frequent watering to minimize wind erosion during construction; and
  - Rock check dams

- Permanent structural practices for this site shall include:
  - Outlet protection using stone riprap as specified;
  - Utilize storm sewer collection system that will be tested for water tightness;
  - Sedimentation basins will also serve as a temporary sediment basin;
  - Vegetated and/or riprap lined swales.
  - Retaining walls

All erosion and sediment control measures will be designed in accordance with the New York State Standards and Specifications for Erosion and Sediment Controls. The site contractor will be required to adhere to all erosion and sediment control measures as defined in the SWPPP.

Since the building will be constructed in a single phase, a waiver to disturb more than five (5) acres at a time will be required. To obtain the five-acre waiver, at least two site inspections be required to be performed during construction by a qualified professional, every seven days, for as long as the disturbed area exceeds five acres. This increased frequency of inspection will ensure that the erosion and sediment control facilities are functioning as designed and that there are no impacts to the waters of the U.S.

Based on the above, there will not be a significant impact on stormwater runoff from the project site.

Water Usage: Water will be supplied through the Town of Florida Water District. There is an existing 10" water main located along the north side of Route5S. A new service lateral for both potable and fire service will be installed and connected to the existing water main.

Based on loading rates established by the New York State Design Standards for Intermediate Sized Wastewater Treatment Systems (March 2014), water usage for the facility is conservatively estimated as follows:

Use	Unit	Gallons Per Day (GPD)	Project	Estimated Daily Usage
"Factory/Distribution Warehouse"	Per Employee/shift	15	200 employees x 2 shifts	6,000
	Per Shower	10	4	40
			Total	6,040 gpd

The facility will require potable water solely for bathroom and shower facilities. Additional water usage for processing or other non-potable uses is not needed. Per NYS Building Code the building will be sprinkled. To ensure adequate fire flow capacity a new water tank will be installed. It will be located on the western edge of the site and sized according to NYS Building Code.

Based on the above, this project will not have a significant impact on the municipal water system.

Sanitary Sewer: The projected sanitary waster generation is expected to be comparable to water usage. A new sanitary sewer lateral will be installed from the building to the existing 10" sanitary sewer main located along the south side of Route 5S, which is part of the Town of Florida Sewer District.

Based on the above, this project will not have a significant impact on the municipal sanitary sewer system.

2.3 Impact on Plants and Animals

A Wildlife Habitat Assessment was completed by AECOM over the course of the spring and summer of 2019. The purpose of the assessment to identify existing wildlife habitat present and the potential for threatened or endangered species. A copy of the report is included as Attachment XX.

This wildlife habitat assessment identified existing habitat cover types and land uses on the site with the objective of identifying ecological resources in the context of the surrounding landscape. For classification purposes, the project site and surrounding areas are divided into ecological communities per the New York Natural Heritage Program (NYNHP) as indicated below. Approximate acreage of each habitat type is provided.

NYNHP Classes for Upland Areas:

- Successional Old Field — 3 +/- acres
- Successional Shrubland — 10 +/- acres
- Rich Mesophytic Forest — 12 +/- acres
- Successional Northern Hardwood Forest — 1 +/- acres
- Crop land (row and field) — 108 +/- acres
- Residential (includes buildings, lawn and impervious surfaces — 9+/- acres

NYNHP Classes for Wetland/Aquatic Areas:

- Shallow Emergent Marsh — < 1 acre
- Shrub Swamp — < 1 acre

- Mixed Emergent/Shrub Swamp 12 +/- acre
- Red Maple-Hardwood Swamp 3 +/- acres
- Rocky Headwater Stream 4,400 +/- linear feet)
- Farm Pond/Artificial Pond < 1 acre

The project is expected to impact a portion of all the upland habitats identified on the project site. The habitats are typical of those found in the region and are not particularly sensitive. The habits are minimally ranked in important by the NYS Natural Heritage Program are considered secure in New York State.

For discussion of impacts to wetland/aquatic habitats refer to Section B - Impact on Surface Water.

Review of the NYS Natural Heritage and US Fish and Wildlife Service databases identified a single federally listed endangered species that has the potential to be present on the site: Northern long-eared bat (*Myotis septentrionalis*). While the northern long ear bat has not been observed on the site, tree cutting restriction will be placed on the project to avoid impacting potential roost trees (> 4" in diameter). No tree clearing will occur between April 1, and October 31 to avoid impacting roosting bats.

Based on the above the project is not expected to have a significant impact on wildlife habitats or threatened or endangered species.

2.4 Impact on Historical and Archaeological Resources

Hartgen Archeological Associates, Inc. (Hartgen) conducted a Phase I and 2 archeological investigation to comply with Section 14.09 of the State Historic Preservation Act. The Phase 1 and 2 have been reviewed by the NYS Office of Parks, Recreation and Historic Preservation (OPRHP). The investigation was conducted according to the New York Archaeological Council's *Standards for Cultural Resource Investigations and the Curation of Archaeological Collections* (1994), which are endorsed by OPRHP.

The Phase 1, which generally consists of a literature search and limited field assessment, identified one area of potential significance. The J. Houck Historic Site was identified on the west-central portion of the project site, adjacent to the right-of way of old NY Route 5S. The site consists of the remains of a house foundation and well.

Shovel tests in the area identified artifacts suggesting an occupation from circa 1830 through 1910. Since avoidance of this area is not feasible, Hartgen recommended that a Phase II archeological site evaluation be completed to determine if the site is National Register eligible.

Artifacts collected during the Phase II investigation are consistent with an occupation lasting from the early to mid-19th century until the early 20th. There are two distinct midden[1] deposits on the site, one from the 1920's and the other from the 1930's that postdate the occupation phase. There is no indication of disturbance of the site, suggesting that the site retains its integrity and has the potential to provide useful data.

[1] A midden is an old dump for domestic waste which may consist of animal bone, botanical material, ceramics, and other artifacts associated with past human occupation

The artifact distribution is quite restricted with almost all recovered materials from both Phases I and II being restricted to a 110' radius around the structure foundations. The collection is a typical domestic assemblage including ceramics, glass and food remains.

The Phase II concluded that the J. Houck Historic Site contains significant archaeological data in undisturbed contexts. Since the site cannot be avoided, a Phase III Data Retrieval Plan (DRP) was prepared and submitted to the OPRHP.

In general, the DRP will complete additional testing near the structure to further understand the form and construction history of the building and acquire additional samples of contemporary artifacts. A temporary sump will be installed to lower the level of local ground water and allow excavation within the basement hole.

The existing well will be bisected with a backhoe trench to determine if useful data can be acquired from below the layer of field cobbles currently preventing sampling. An area of approximately 20 meters around the house and well will be mechanically stripped of soil in order to identify features such as middens or privies. If encountered, these features will be studied and sampled as needed.

The OPRHP has reviewed and approved the DRP. Correspondence from OPRHP along with copies of the Phase 1, 2 and DRP are included herein as Attachment 7.

Since all significant artifacts will be recovered as part of the DRP, which is expected to be completed in the Fall of 2019, the project will not have a significant impact on historical or archaeological resources.

2.5 Impacts on Transportation

Creighton Manning Engineering, LLP has completed a traffic impact study for the proposed development. Refer to Attachment 10.

Data collection for the traffic study included an automatic traffic recorder installed on NY Route 5S, east of Target Drive and traffic counts collected at:

- NY Route 5S/Route 920P/Clark Drive
- NY Route 5S/Target Drive

These counts were supplemented by traffic counts conducted by NYSDOT in 2018 at:

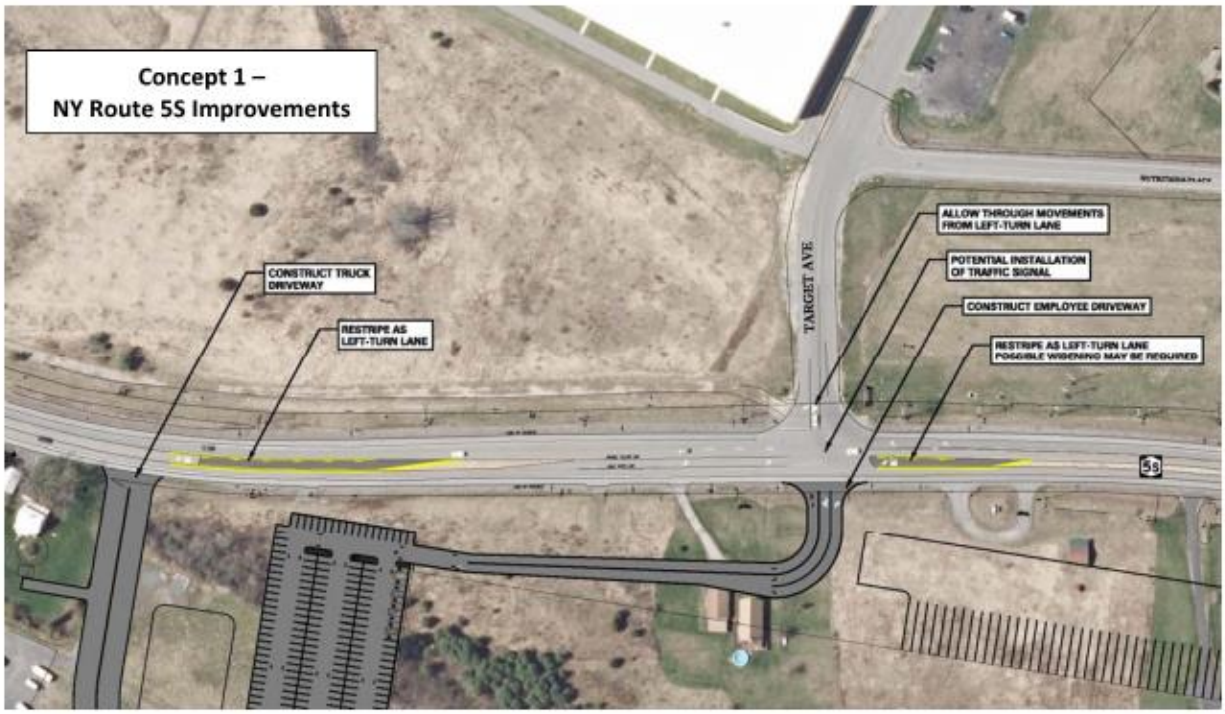
- NY Route 5S/PS Street/Route 30 SB Ramp
- NY Route 5S/Route 30 NB Ramp
- NY Route 30 SB/Route 5S Ramp
- NY Route 30/Thruway Exit 27

This traffic study focuses on the AM and PM peak periods since these time periods correspond to peak operations at the site and peak traffic conditions on the surrounding roadway network. The peak hours varied but generally occurred from 8:00 to 9:00 a.m. in the morning and 4:00 to 5:00 p.m. in the afternoon.

Based on the Institute of Transportation Engineers (ITE) *Trip Generation (*10th edition), the project is estimated to generate 120 trips during the AM peak hour of the generator (96 employee trips and 24 truck trips) and 162 trips during the PM peak hour of the generator (130 employee trips and 32 truck trips).

The level of service analysis indicates that the signalized study area intersections and the unsignalized NY Route 5S/NY Route 920P/Clark Drive intersection will continue to operate similar to No-Build conditions after build-out for the proposed development during the AM and PM peak hours. No mitigation is recommended at these signalized and unsignalized study area intersections.

Access to the Employee Driveway associated with the proposed *Exit 27 Warehouse* will be provided opposite Target Drive on NY Route 5S. It is recommended that a shared left- turn/through lane and a separate right turn lane be constructed on the southern leg of the intersection. In addition, the southbound left-turn lane currently provided on Target Drive should be modified to allow through movements to the Employee Driveway.



It is also recommended that the existing hatched median currently provided opposite the exclusive eastbound left-turn lane be restriped to provide an exclusive westbound left- turn lane in this area for employees associated with the site. NY Route 5S may need to be widened to accommodate the left-turn lane and that any proposed changes to NY Route 5S will be reviewed by NYSDOT as part of a Highway Work Permit.

The level of service analysis indicates that the southbound left-turn lane will operate at LOS F and that the northbound left-turn lane will operate at LOS E under unsignalized build conditions during the PM peak hour.

A signal warrant analysis indicates that 2020 Build traffic volumes over the course of a typical day will not be high enough to meet the minimum traffic signal criteria for the three signal warrants investigated; however, a review of the data indicates that all three signal warrants are close to being met.

It is recommended that an after study be completed at this intersection after the site is fully operational to determine if a traffic signal is truly warranted since the build volumes are based on future traffic projections. If an after study confirms that a traffic signal is indeed warranted, the Applicant will install the signal subject to review and approval by NYSDOT. The analysis indicates that this intersection will operate at good levels of service under traffic signal control.

It is recommended that the existing hatched median currently provided west of the exclusive eastbound left-turn lane for Target Drive be restriped to provide an exclusive westbound left-turn lane for trucks associated with the site. It is not anticipated that NY Route 5S will need to be widened to accommodate the left-turn lane in this area; however, any proposed changes to NY Route 5S will be reviewed by NYSDOT as part of a Highway Work Permit.

The analysis indicates that this intersection will operate at good levels of service under stop sign control. A stop sign is recommended on the northbound Truck Driveway approach.

The available intersection and stopping sight distances at the Employee and Truck Driveways on NY Route 5S meet AASHTO guidelines for the 65-mph operating speed for the applicable design vehicle.

It is recommended that any site signing be placed a minimum of fifteen feet back from the travel way and that the landscaping plan consider sight lines in order to maintain visibility at the proposed driveway locations.

A review of crash history on NY Route 5S indicated that most accidents were classified as “other” and involved running off the road or collisions with earth, ditch, rock, etc. or deer. The majority involved property damage only or were non-reportable (having damage less than $1,000 and no injuries). There were no fatalities and only four injury crashes.

2.6 Impact on Energy

National Grid (NG) currently provides natural gas and electric in the Town of Florida and it is anticipated that the project will use National Grid for these services. Application has been made to National Grid for new electric and gas service. It is not expected that the project will have a impact on existing energy supplies.

The electric distribution system on site will consist of a below ground duct bank system with ground mounted transformers. Natural gas will be piped underground into the building mechanical room to run the buildings heating system.

To minimize energy consumption, the project will review and implement energy saving measures where practicable. These may include:

- Optimized building envelope and insulation through energy modelling
- LED lighting
- Air Turnover Units to de-stratify building;
- Minimization of "vampire loads" for all material handling equipment
- Incorporation of high-efficiency carousels and automated storage and retrieval system conveyors, etc.
- Incorporation of programmable lighting controls
- A natural gas transmission main crosses the site north-south along the eastern limits. Refer to Attachment 4 for the location of the gas main. The natural gas main will be avoided during construction except for a single driveway crossing to prove access to tractor trailer storage lot. Crossing of the gas main will require review and approval by National Grid.

2.7 Impact on Light

Lighting will be provided for the parking lot areas, loading docks and along the two driveways. The lighting will consist of energy efficient LED light fixtures with a color temperature range of 3000 to 3500k. All lighting will have full cutoff and be dark sky friendly minimize the potential for glare and light spillage.

The light fixtures will be mounted on 40' poles and along the loading docks with full cut wall packs. The foot-candle level will be zero at the property line, except for the driveway/Route 5S intersections, which will be slightly elevated for safety.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Langan were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Appendix G Resumes of Environmental Professionals

ANNA STATKIEWICZ

PROJECT SCIENTIST

ENVIRONMENTAL

3 Crossings Development, Pittsburgh, PA

Project Goliath, North Randall, OH

Ms. Statkiewicz has seven years of experience in environmental consulting, primarily focused on environmental site characterization and remediation projects. Her diverse project experience includes site characterization, due diligence assessments, remedial investigations and designs, construction oversight for remedial design implementation, vapor intrusion investigations, SPCC and PPC plans, NPDES permits, storage tank removals, wetland delineation and stream identification, acid mine drainage treatment and local zoning permits. Ms. Statkiewicz has also performed investigations and remediation under the Pennsylvania Land Recycling Program ("Act 2") and the Ohio Voluntary Action Program. In addition to investigation and permitting support, Ms. Statkiewicz has also assisted with managing a nationwide due diligence portfolio for a confidential e-commerce client. Prior to her tenure at Langan, Ms. Statkiewicz completed a graduate degree in Geology at University of Maryland, College Park. At Maryland, her graduate research focused on how the interaction among vegetation, hydrology, and geomorphology affects the stability of tidal channel inlets.

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 4/16/2025 at 6:30 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

APPENDIX 12

Route 5S & Mead Rd – MSV1 Development Project
Air Quality Dispersion Modeling Analysis

Bluewater Property Group
April 17, 2025

INTRODUCTION

MSV1 (the "Project") is a proposed warehouse development located to the southwest of the New York Route 5S and Mead Road intersection in the Town of Florida, Montgomery County, New York (the "Site"), identified in Figure 1 below. The Study is conducted in support of the Town of Florida Planning Board's review of the potential environmental impacts of the Project pursuant to SEQRA and its implementing regulations in 6 NYCRR Part 617. The Project is located adjacent to a Disadvantaged Community (DAC), census tract #36057070200, as identified by the New York's Climate Justice Working Group under the Climate Act. To address the potential for adverse impacts to local air quality caused by Project-related traffic, the Study is intended to assess potential local air quality impacts under conservative scenarios. The Study focused on anticipated air emissions from mobile sources (i.e., passenger vehicles and long-haul trucks) associated with the Project and compared those emissions to the current National Ambient Air Quality Standards (NAAQS). The NAAQS are established by the United States Environmental Protection Agency (USEPA) and quantify maximum safe concentrations of air pollutants in ambient air on varying time-averaged durations of exposure.

Benzene, which is considered a High Toxicity Air Contaminant ("HTAC"), is identified as a potential pollution exposure factor in DACs; therefore, benzene emissions were also quantified and compared to the respective HTAC thresholds listed in the New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR)-guidelines. The potential for air quality impacts from mobile sources on ozone that may be associated with the Project were also qualitatively assessed.

The Study found potential concentrations associated with the anticipated traffic counts in 2027 are expected to remain below the current HTAC and NAAQS thresholds, as shown in Table 1 and described herein. Projected contributions of volatile organic compounds (VOCs) (i.e., benzene) to the formation of ozone are also expected to be minor. Therefore, it can be assumed that air quality impacts on the surrounding community will not be significant.

Figure 1 – Site Location Map

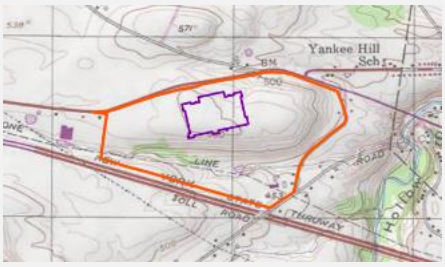

Figure 2 – AERMOD Setup

Figure 3 – Receptor Map

STUDY OBJECTIVES

A modeling program was developed to evaluate the potential impacts of anticipated Project-related traffic volumes on local air quality from traffic generated both onsite and on identified intersections along Route 5S, which is the projected route for project-generated traffic. The objectives of the modeling program were to:

- Estimate emissions of the key air pollutants associated with anticipated Project-related traffic volumes in 2027, the expected completion year of all developments within the Project. Key air pollutants modeled include: carbon monoxide (CO), nitrogen dioxide (NO_2), particulate matter less than 2.5 microns ($PM_{2.5}$), and particulate matter less than 10 microns (PM_{10});
- Compare estimated Project-related emissions to the NAAQS;
- Estimate benzene emissions, which is considered a HTAC and identified as a potential pollution exposure factor in Disadvantaged Communities (DACs);
- Compare estimated benzene emissions to the NYSDEC DAR-1 guideline thresholds; and
- Qualitatively assess the potential for air quality impacts associated with ozone.

STUDY PROCEDURES

Air quality modeling was performed using the following EPA-approved air modeling software:

- EPA's Motor Vehicle Emission Simulator (MOVES5); and
- American Meteorological Society Model (AERMOD).

Vehicle movements for intersections that exceeded the applicable traffic volume thresholds established by either the New York City Environmental Quality Review (CEQR) Technical Manual or the New York State Department of Transportation (NYSDOT) were modeled using LINE sources, as were on-site vehicle movements. On-site parking areas were modeled using AREA sources. LINE and AREA sources are shown in Figure 2. Receptors (i.e., locations where the model calculates pollutant concentrations) were placed in a grid with 25-meter spacing at sensitive receptors including schools, nursing homes, and residential neighborhoods within a one-mile radius of the Project study area, as shown in Figure 3. The maximum downstream concentrations predicted by the model were added to published background concentrations and compared to the NAAQS. Published background concentrations were obtained from the New York State Ambient Air Quality Report published by NYSDEC (2023).

The models and calculations used the highest expected traffic counts from each period of the day broken into AM, midday, PM, and overnight, known as peak hour traffic counts, associated with the Project to predict estimated passenger vehicle (passenger cars and passenger trucks) and truck emissions associated with the Project. Emission rates obtained from MOVES5 were entered into AERMOD, and the predicted maximum downstream concentrations from the Project were added to the background concentrations and then compared to the current NAAQS.

RESULTS

The Study found that potential emissions associated with the anticipated passenger and truck traffic counts generated from the Project in 2027 will not be significant.

Modeled benzene concentrations of 0.15 ug/m^3 for short-term and 7.98E-02 ug/m^3 for annual are below the respective thresholds in DAR-1 of 27 ug/m^3 and 1.30E-01 ug/m^3, respectively. VOCs are a group of compounds and do not have an associated NAAQS; however, as described above, the Study considers benzene, which is also considered a VOC. Benzene concentrations are below the respective thresholds in DAR-1; therefore, projected contributions of VOCs to the formation of ozone are also expected to be minor.

The anticipated traffic counts associated with the Project, when added to the highest measured pollutant background concentrations, are expected to remain below the current NAAQS, as shown in Table 1 below.

TABLE 1
2027 AMBIENT AIR QUALITY MODELING RESULTS SUMMARY

POLLUTANT	AVERAGING PERIOD	PREDICTED DOWNSTREAM CONC.	NYSDEC BACKGROUND CONC.	TOTAL CONC.	PRIMARY NAAQS	SECONDARY NAAQS
		MICROGRAM/CUBIC METER (UG/M^3)				
CO	1-hour	543.36	2,999.9	3,543.3	40,075	--
	8-hour	166.96	1946.5	2,113.5	10,350	--
NO_2	1-hour	17.78	104.7	122.5	188	--
	Annual	0.38	25.3	25.7	100	--
$PM_{2.5}$	24-hour	2.05	24.0	26.1	35	35
	Annual	0.69	8.0	8.7	9	15
PM_{10}	24-hour	6.48	70	76.5	150	150

[1] To compare the results to the USEPA NAAQS, the 8th high concentration for 1-hr NO_2 and 24-hr $PM_{2.5}$.

The purpose of the NAAQS "primary standards" is to provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly, while the purpose of the secondary NAAQS is to provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. These standards are routinely used to determine the overall potential for impacts to sensitive receptors. With the projected pollutant concentrations anticipated to remain below both the primary and secondary NAAQS, it can be assumed that air quality impacts on the surrounding community will not be significant.

Re: Route 5S & Mead Rd – MSV1
Air Quality Dispersion Modeling Analysis
Town of Florida, New York
Langan Project No.: 140248201

EXECUTIVE SUMMARY

MSV1 (the "Project") is a proposed warehouse development located to the southwest of the New York Route 5S and Mead Road intersection in the Town of Florida, Montgomery County, New York (the "Site"). To evaluate the potential ambient air quality impacts of the Project, the potential future emissions from mobile sources (i.e., passenger vehicles and long-haul trucks) both onsite and on identified intersections along Route 5S were estimated using Environmental Protection Agency ("EPA")-approved modeling software and traffic volume projections. The air quality dispersion modeling results were compared to EPA's National Ambient Air Quality Standards ("NAAQS") to determine if there are potential air quality impacts to nearby sensitive receptors (i.e., local residential areas and schools). In addition, benzene, which is considered a High Toxicity Air Contaminant ("HTAC"), emissions were also quantified and compared to the respective HTAC thresholds listed in the New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR)-1 guidelines. The potential for air quality impacts from mobile sources on ozone that may be associated with the Project were also qualitatively assessed. Based on projected worst-case peak hour passenger vehicle and truck traffic volumes broken down by daily time periods, the Project is not anticipated to result in any exceedance of the applicable HTAC or NAAQS thresholds at receptor locations. Projected contributions of relevant pollutants to the formation of ozone are also expected to be minor.

INTRODUCTION

Langan Engineering, Environmental, Surveying, Landscape Architecture, and Geology, DPC ("Langan") has prepared this memorandum to document results of this ambient air quality study (the "Study") conducted for the Project. Based on traffic volumes provided in the Traffic Impact

Study ("TIS") submitted for the Project[1], the Study includes ambient air quality dispersion modeling to simulate potential future conditions using current operational assumptions and methodology outlined in guidance documents provided by the EPA, New York State Department of Transportation ("NYSDOT"), New York State Department of Environmental Conservation ("NYSDEC"), and the New York City Environmental Quality Review ("CEQR") Technical Manual. Note, the State Environmental Quality Review Act ("SEQRA") guidance is typically used for projects located outside of New York City in the State of New York; however, SEQRA does not explicitly outline methodology for detailed mobile source air quality assessments. The CEQR Technical Manual provides specific guidance for mobile source air quality assessments and is designed for projects located within New York City, which generally has poorer background air quality and is less tolerant to air quality impacts compared to the rest of New York State. Therefore, CEQR guidelines were conservatively used for the Study in the absence of applicable SEQRA guidance. This memorandum describes the modeling methodology, results, and overall findings of the Study.

PURPOSE

The Study is conducted in support of the Town of Florida Planning Board's review of the potential environmental impacts of the Project pursuant to SEQRA and its implementing regulations in 6 NYCRR Part 617. The Project is located adjacent to a Disadvantaged Community (DAC), census tract #36057070200, as identified by the New York's Climate Justice Working Group under the Climate Act. To address the potential for adverse impacts to local air quality caused by Project-related traffic, the Study is intended to assess potential local air quality impacts under conservative scenarios for identified receptors both inside and outside the DAC along the primary traffic route (i.e., Route 5S). The Study focuses on projected air emissions from mobile sources (i.e., passenger vehicles and long-haul trucks) and compares those emissions to the current NAAQS. The NAAQS quantify maximum concentration levels of air pollutants in ambient air on varying time-averaged durations of exposure to provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly.

Benzene is identified as a potential pollution exposure factor in DACs; therefore, benzene emissions were also quantified and compared to the respective HTAC thresholds listed in the NYSDEC DAR-1 guidelines. The potential for air quality impacts from mobile sources on ozone that may be associated with the Project were also qualitatively assessed.

SCOPE OF STUDY

The Study focuses on the potential air quality impacts from projected traffic generated on the Site located to the southwest of the New York Route 5S and Mead Road intersection in the Town of Florida, Montgomery County, New York, as analyzed in the TIS. The Study also accounts for

[1] Langan Engineering, Environmental, Surveying, Landscape Architecture, and Geology, DPC, NYSDOT Traffic Impact Study (April 2025). Note, trip generation counts presented in the TIS assume a 10% carpool utilization rate based on data published by the U.S. Census Bureau for the Town of Florida in Montgomery County. This Study conservatively assumes a 0% carpool utilization rate to evaluate potential air quality impacts under a worst-case scenario.

impacts of nearby intersections, which were included based on the CEQR Technical Manual (December 2021 Edition) and NYSDOT traffic screening thresholds. Nearby intersections that exceed either the CEQR peak hour passenger vehicle or truck volume screening thresholds, or the NYSDOT Level of Service ("LOS") and traffic volume increase thresholds are conservatively included in the model, in addition to driveways and parking areas at the Project.

Objective and Approach

The objective of the Study is to assess and quantify potential impacts of mobile sources on ambient air quality for receptors that would potentially be affected by the Project in the year 2027 using the traffic data provided in the TIS. Accordingly, to evaluate the potential impact of anticipated traffic volumes on ambient air quality at nearby receptor locations, air quality models were based on the latest available projected traffic data at the time of the Study. Projected traffic counts and vehicle types were accordingly based on the "build" scenarios in the TIS.

MOBILE SOURCES

Mobile Sources – Proposed Distribution Center

The Study includes estimated air emissions from mobile sources at the Project, which is identified in Figure 1, attached. Projected vehicle counts were modeled on onsite driveways and parking areas associated with the Site, as well as identified off-site intersections, as described below.

Mobile Sources – Intersections

The Study assesses intersections that include traffic generated from the proposed Project. The intersections for which traffic data was provided in the TIS were compared to the CEQR and NYSDOT traffic screening thresholds. To conservatively account for both CEQR and NYSDOT screening methodologies, any intersection that surpasses either the CEQR or NYSDOT screening thresholds is evaluated in the Study.

The CEQR screening thresholds require evaluation of intersections for projects that would generate an incremental increase in peak hour traffic resulting in the following scenarios:

- 170 or more auto trips,
- 12 or more heavy duty diesel vehicles for paved roads with average daily traffic fewer than 5,000 vehicles,
- 19 or more heavy duty diesel vehicles for collector roads,
- 23 or more heavy duty diesel vehicles for arterial roads; or,
- 23 or more heavy duty diesel vehicles for expressways and limited access roads.

The NYSDOT Level 2 screening thresholds require evaluation of intersections with LOS levels of D, E, or F, and a traffic volume increase of 10% or greater.

As shown in Attachment 1, three of the intersections in the TIS exceeded the screening thresholds described above and were modeled in the Study. These three intersections are as follows:

- Route 5S and Target Drive East
- Route 5S and West Driveway
- Route 5S and East Driveway

The locations of the Project and three intersections evaluated in the Study are provided in Figure 1, attached.

Mobile Sources - Modeling Approach

Pollutants of Concern

This Study uses EPA Motor Vehicle Emission Simulator ("MOVES5"), and EPA and American Meteorological Society Model ("AERMOD") modeling software (Version 23132) to calculate the projected concentrations of the following criteria pollutants: CO, NO_2, $PM_{2.5}$, and PM_{10}. Both MOVES5 and AERMOD are EPA-approved modeling software for estimating emissions and concentrations of pollutants generated from mobile emission sources, respectively. Predicted concentrations of pollutants from the modeling scenarios were compared to the current NAAQS.

Benzene, which is considered a High Toxicity Air Contaminant ("HTAC"), is identified as a potential pollution exposure factor in DACs; therefore, benzene emissions were also quantified in MOVES5 and compared to the respective HTAC threshold in NYSDEC's air quality regulations in 6 NYCRR Subpart 212-2.2, Table 2 ("Table 2"). The thresholds identified in Table 2 are applicable to stationary sources; however, because there is no equivalent regulatory framework for mobile air toxics, the HTAC limit in Table 2 was conservatively applied to determine if benzene required further evaluation. As shown in Attachment 1, benzene exceeds the thresholds in Table 2; therefore, warranting further evaluation.

Emission Rates

Mobile source emission rates projected in 2027 were calculated using MOVES5 and maximum projected peak hour traffic counts of passenger cars, passenger trucks, and heavy-duty vehicles. Traffic data for the Project and identified intersections during peak weekday morning (AM) and afternoon (PM) is based on the latest available projected traffic data at the time of the Study. Traffic data for weekday midday (MD) and overnight (ON) peak hours were estimated based on the distribution of vehicles during the respective time periods obtained from 24-hour Automatic Traffic Recorder ("ATR") counts on Route 5S.

These time periods are defined as follows, based on the EPA PM Hotspot Guidance[2]:

- AM: 06:00-09:00
- MD: 09:00-16:00
- PM: 16:00-19:00
- ON: 19:00-06:00

Site-generated peak hourly traffic data was applied to on-site parking areas and traffic movements. Conservatively, the maximum Project-specific traffic counts for each peak hour are used in the model for the associated time period (e.g., the AM peak hour traffic counts are used across the AM time period of 06:00-09:00). Emission factors specific to each peak hour traffic period are applied to their respective peak hour traffic volume and normalized based on vehicle categories obtained from NYSDEC-published data. On-site movements were normalized for their respective vehicle types (i.e., light-duty or heavy-duty trucks) and off-site movements (i.e., intersections) were normalized based on 2023 NYSDEC Montgomery County vehicle categories[3]. These emissions factors were entered as seasonal values in AERMOD to represent varying emissions rates and traffic volumes throughout each applicable time period, day of the week, and season throughout the year.

MOVES5 runs were generated for January, April, July, and October to account for seasonal variation. MOVES5 calculates mobile source emissions rates in units of grams per hour (g/hr). The MOVES5 modeling scenarios operate under the following assumptions:

1. Starting emissions "starts" are applied to passenger vehicles leaving the facility ("outs") during morning and evening peak hour traffic. These "starts" are conservatively assumed to be cold starts based on anticipated employee shift schedules at the proposed distribution center[4].
2. Idling emissions are applied to passenger vehicles and trucks leaving the facility (i.e., outs). It is conservatively assumed that every vehicle leaving the facility remains idle for a period of 5 minutes before exiting corresponding parking lots based on 6 NYCRR 217-3.2.
3. Running emissions are assumed to have occurred across the furthest possible representative on-site routes for cars and trucks traveling at an average speed of 15 miles per hour (mph). These onsite movements include parking lot aisles, driveways, and Site

[2] EPA, PM Hot-Spot Guidance: Transportation Conformity Guidance for Quantitative Hot-Spot Analyses in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas (October 2021). The EPA PM Hotspot Guidance provides instructions for conducting quantitative hot-spot analyses for highway and other transit projects in $PM_{2.5}$ and PM_{10} nonattainment and maintenance areas. The guidance covers transportation conformity requirements, technical guidance on estimating project emissions using MOVES and other methods, and the application of EPA's AERMOD dispersion model for PM hot-spot analyses.

[3] Information provided by NYSDEC on April 4, 2025.

[4] Cold starts for employee vehicles (passenger cars and passenger trucks) are assumed to have a soaking time between 360 and 720 minutes. Cold starts for heavy duty vehicles are assumed to have a soaking time between 120 and 260 minutes. Soak time is defined as the time period between when a vehicle engine is turned off and when the engine is turned on again. Soak times were chosen based on anticipated tenant-specific operations.

entrances/exits. On-site speed limits are expected to be between 15 and 25 mph. Slower traveling speeds generally correspond with greater emissions of pollutants; therefore, 15 mph is used as a conservative assumption to replicate total estimated road length and speed during operation of the Site.

4. Road dust emissions are calculated for PM_{10} and $PM_{2.5}$ assuming a silt loading value of 0.015 grams per square meter (g/m^2) for expressways, 0.1 g/m^2 for arterial roads, 0.16 g/m^2 for collector roads, 0.4 g/m^2 for local paved roads, and an average vehicle weight of 6,000 pounds, in accordance with the CEQR Technical Manual.

Mobile source emission rates are summarized in Attachment 1.

Mobile Sources - Modeling Procedures and Assumptions

A representative model of the on-site vehicle routes and applicable intersections' geometry are constructed in AERMOD, and receptors are placed per CEQR and EPA guidance as shown on Figure 2 and summarized in Table A below. Emissions generated from build scenario traffic volumes are modeled at the identified analysis locations for the respective pollutant averaging periods. Trips are assigned to each travel lane and turning movement per the respective TIS traffic volume tables. A summary of the mobile source AERMOD modeling assumptions is provided below.

Table A. AERMOD Modeling Assumptions

Data Type	Input Value	Notes
Intersections and On-site Vehicle Movements		
Source	LINE	The three intersections and on-site vehicle movements are modeled as LINE source types.
Width of Source	3.3 m	(per lane)
Parking Areas		
Source	AREA	The on-site parking areas are modeled as AREA source types.
All Sources		
Pollutant	CO (1-hr, 8-hr); NO2 (1-hr, Annual); PM2.5 (24-hr, Annual); PM10 (24-hr); Benzene (1-hr, Annual)	Benzene emissions were modeled using a unitized emission rate of 1 g/s-m^2. Resulting concentrations were normalized based on corresponding MOVES emission rates to calculate predicted benzene concentrations.
Initial Vertical Dimension	2.6 m (LDV); 6.8 m (HDV)	The combined initial vertical dimension are estimated using a weighted average (i.e., average of LDV and HDV contribution).
Release Height	1.3 m (LDV); 3.4 m (HDV)	Initial vertical dimension multiplied by 0.5.
Emission Rate	MOVES-based emission rates (g/s)	EPA AP-42 emission factors are used for road dust calculations.
Urban/Rural	Rural	Based on DAR-10 land use classification.

Meteorological Data

Per EPA Appendix W, five years of the latest available representative meteorological data was obtained from NYSDEC. Surface and upper-air data were obtained from the Montgomery County Airport station. The most recent years of data available are 2018 to 2022 because 2023 data is incomplete, due in part to a nationwide helium shortage, as well as building construction at the National Weather Service office, which prevented the launch of any upper air balloons during that time. Therefore, the model uses the complete 2018 to 2022 meteorological dataset.

Receptors

Receptors are placed at a flagpole height of 1.8 meters to represent pedestrian height. Based on EPA PM Hotspot Guidance, a receptor grid was generated to cover areas of public access and residential areas within approximately one mile of the Project southwest of the Mohawk River. The receptors in the grid are spaced 25 meters apart. Based on DAR-10 guidance, receptors within the Project's site boundary are excluded from the model as it is anticipated there will be no public access to these areas. The surrounding area was reviewed for sensitive locations, such as schools, hospitals, and nursing homes, which may be affected by onsite emissions from onsite vehicle movements (i.e., running emissions on driveways, starting and idling emissions at parking lots) and offsite emissions from identified nearby intersections. The receptor grid shown in Figure 3 covers nearby sensitive locations including a nursing home, River Ridge Living Center, located at 100 Sandy Drive, Amsterdam, NY and a school, William Barkley School, located at 66 Destefano Ave, Amsterdam, NY.

Background Concentrations

Background concentrations were obtained from representative regional monitoring stations provided in the latest NYS 2023 Ambient Air Quality Report published by NYSDEC. Background 24-hour and annual PM2.5 concentrations were obtained from the Albany monitoring station based on proximity to the Project and similarity of climate, population, and topography per NYSDEC DAR-10 guidelines[5]. The Albany monitor is located approximately 48 kilometers from the Site. According to United States Census data, the population density of Albany is 1,826 people per square kilometer, while the population density of the Town of Florida, where the Site is located, is 495 people per square kilometer. Albany is more densely populated than the Town of Florida, therefore, it is reasonably assumed to be a conservative monitor.

More densely populated areas, such as Albany and Queens (discussed below), typically experience greater vehicle emissions compared to a less densely populated area due to the higher concentration of residents and businesses that necessitate increased transportation

[5] NYSDEC, DAR-10: NYSDEC Guidelines on Dispersion Modeling Procedures for Air Quality Impact Analysis (November 8, 2019).

The DAR-10 guidelines outline recommended air dispersion modeling procedures for ambient air quality impact analyses. It builds on the EPA's approved methodologies, particularly those in 40 CFR Part 51, Appendix W, and includes additional recommendations specific to New York regulations.

activities. With more people living and working in close proximity, the demand for personal vehicles, public transportation, and commercial delivery services rises, leading to a higher volume of traffic on the roads. This increased traffic results in greater fuel consumption and consequently higher emissions of pollutants such as CO, NO_2, and PM. Furthermore, congestion in densely populated areas often causes idling and stop-and-go traffic, which exacerbates emissions of these pollutants.

CO, NO_2, and PM_{10} background concentrations were obtained from the Queens monitoring station. The Queens monitoring station is located approximately 243 kilometers from the Site. According to United States Census data, the population density of Queens County is 8,590 people per square kilometer. The Queens monitoring station is adjacent to the Horace Harding Expressway, which has an average daily vehicle count of 173,227, per NYSDOT data. The maximum vehicle counts in proximity to the Project location based on NYSDOT data is along Route 5S, which has an average daily vehicle count of 5,221. Queens is a more densely populated area than the Town of Florida, with more traffic on nearby roads and potential for more air quality impacts; therefore, it is reasonably assumed to be a conservative monitor.

Ambient background concentrations are added to the modeling results obtained from AERMOD to estimate the total concentrations at the identified receptors. Concentrations at receptor locations are compared against the respective NAAQS.

Ozone

Langan considered the potential for air quality impacts from mobile sources on ozone that may be associated with the Project.

Ozone is a colorless gas composed of three oxygen atoms, known chemically as O_3. It occurs both in the Earth's upper atmosphere and at ground level. Ground-level ozone is a major component of smog and poses health risks to humans, animals, and vegetation. The formation of ground-level ozone is a photochemical process involving precursor pollutants such as NO_X and volatile organic compounds (VOCs). These precursors are emitted from various sources, including vehicular emissions.

When NOX and VOCs are released into the atmosphere, they undergo a series of chemical reactions in the presence of sunlight, leading to the formation of ozone. Due to the intricate, nonlinear nature of these chemical reactions and the influence of various environmental factors such as temperature, humidity, and sunlight, air quality modeling software such as AERMOD, which is designed to predict the physical dispersion of pollutants, cannot accurately model ozone emissions.

In addition, ozone impacts are typically analyzed on a regional scale rather than from individual sources due to the nature of ozone formation and its ability to travel long distances, particularly during time periods of significant sunlight. Ozone precursors (e.g., NO_X and VOCs) can originate from various sources, including industrial activities, vehicular emissions, and natural sources like wildfires. Once formed, ozone can be transported by wind patterns across regions, potentially hundreds of miles away from its original source. This long-range transport means that ozone

levels in a particular area are influenced not only by local emissions but also by emissions from distant regions.

As described in the Findings and Conclusions section below, projected emissions of NOx associated with projected mobile sources in 2027, added to background concentrations, would not result in an exceedance of the applicable NAAQS and therefore, projected contributions of NOx to the formation of ozone are expected to be minor.

VOCs are a group of compounds and do not have an associated NAAQS; however, as described in the Pollutants of Concern section above, the Study considers benzene, which is also considered a VOC.

FINDINGS AND CONCLUSIONS

The Study found projected emissions associated with projected mobile sources in 2027, added to background concentrations, would not result in an exceedance of the applicable NAAQS at any receptor locations, including at sensitive receptor locations. A summary of the modeled results and background concentrations compared to the applicable NAAQS is included in Table B below.

TABLE B
2027 AMBIENT AIR QUALITY MODELING RESULTS SUMMARY

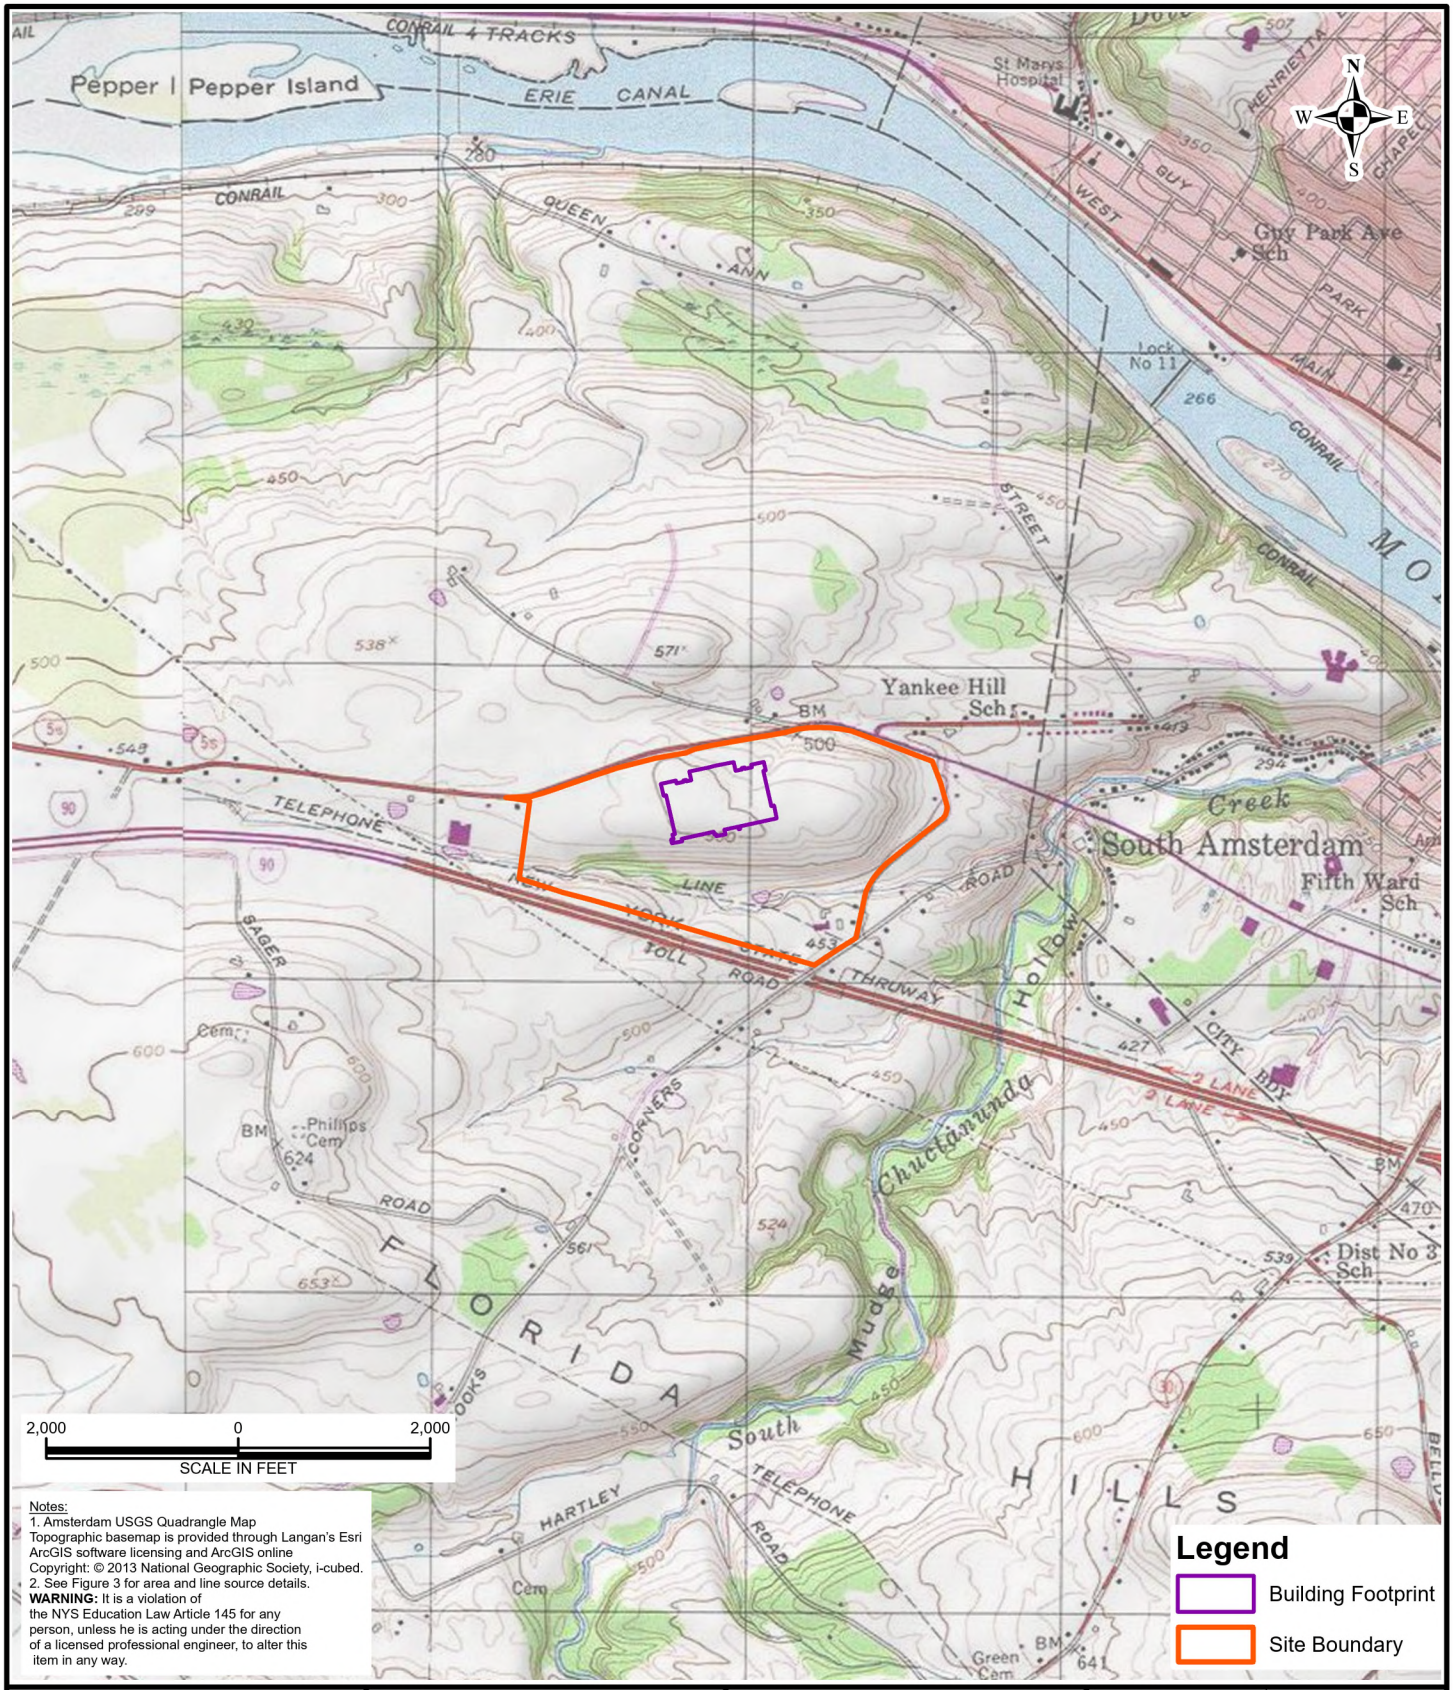
POLLUTANT	AVERAGING PERIOD	PREDICTED DOWNSTREAM CONC.	NYSDEC BACKGROUND CONC.	TOTAL CONC.	PRIMARY NAAQS	SECONDARY NAAQS
		MICROGRAM/CUBIC METER (UG/M^3)				
CO	1-hour	543.36	2,999.9	3,543.3	40,075	--
	8-hour	166.96	1946.5	2,113.5	10,350	--
NO_2	1-hour	17.78	104.7	122.5	188	--
	Annual	0.38	25.3	25.7	100	--
$PM_{2.5}$	24-hour	2.05	24.0	26.1	35	35
	Annual	0.69	8.0	8.7	9	15
PM_{10}	24-hour	6.48	70	76.5	150	150

[1] To compare the results to the USEPA NAAQS, the 8th high concentration for 1-hr NO_2 and 24-hr $PM_{2.5}$.

As shown in Table C, modeled benzene concentrations for both short-term and annual averaging periods are below the respective thresholds in DAR-1. Benzene is also considered a VOC. VOCs are a group of compounds and do not have an associated NAAQS; however, as described above, the Study considers benzene, and because benzene concentrations are below the respective thresholds in DAR-1, projected contributions of VOCs to the formation of ozone are also expected to be minor.

TABLE C
2027 HTAC MODELING RESULTS SUMMARY

HTAC	AVERAGING PERIOD	PREDICTED DOWNSTREAM CONC.	NYSDEC DAR-1 THRESHOLD	EXCEEDS THRESHOLD?
		MICROGRAM/CUBIC METER (UG/M^3)		
BENZENE	Short-Term	0.15	27	No
	Annual	7.98E-02	1.30E-01	No



Based on expected compliance with the air quality standards provided above, it is not anticipated that existing and projected mobile sources will have any significant adverse impact on air quality within the Study area. Additionally, the project's contributions to the formation of ozone are expected to be minor.

Notes:

1. Traffic counts based on TIS dated April 2025. Note, the TIS was not finalized at the time of this study; therefore, traffic counts may slightly vary.
2. Per MOVES Technical Guidance, restricted roads are highways that can only be accessed by an on-ramp, while unrestricted are all other roads (arterials, connectors, and local streets).
3. Breakdown of passenger cars and passenger trucks is based on NYSDEC MOVES Input Data for Montgomery County from 2023.
4. Time of day periods ased on the EPA's PM Hotspot Guidance, the following timeframes were assumed for each time of day: AM = 6:00-9:00; MD = 9:00-4:00; PM = 16:00-19:00, ON = 19:00-6:00.
5. The initial vertical dimension is estimated using an emissions-weighted average based on the EPA PM Hot-spot Guidance: Transportation Conformity Guidance for Quantitative Hot-spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas. The following equation is used: (light-duty vehicle contribution [%] * 2.6 [meters]) + (heavy-duty vehicle contribution [%] * 6.8 [meters]).
6. Speeds are based on Synchro tables. Right turning movements were assumed to be 9 mph, while left turning movements were assumed to be 15 mph. Onsite speed limits were conservatively assumed to be 5 mph for area sources (parking lots).

Assumptions:

0.379 passenger cars percent
0.617 passenger trucks percent
0.004 heavy duty trucks percent
0.500 MD percent of AM peak
0.100 ON percent of PM peak

Road Dust Calculations - 24-hr Analysis of PM10 and PM2.5

Per AP-42 Chapter 13.2.1.3 (Equation 1): $[E=k(sL)^{0.91}(W)^{1.02}]$

Table 7a. Road Dust Variables[1,2,3]

Variable[1]	Description	Value	Units
E	PM emission Factor		g/veh-mi
k	Particle Size Multiplier (PM10)	1	g/veh-mi
k	Particle Size Multiplier (PM2.5)	0.25	g/veh-mi
sL_2	Road surface silt loading	0.4	g/m^2
W_3	Vehicle weight	3	tons

Key			
sL_2	**Road Type**	**ADT**	**Definition**
0.015	Expressway	55-75 mph	High speed long distance. Multiple lanes no traffic signals
0.1	Arterial	50-70	Deliver traffic from collector to expressways
0.16	Collector	35-55 mph	Moderate traffic usually 2 lanes and may have traffic signals/stop signs
0.4	Local	Under 5,000	Provides access to commercial or residential properties

TA	Local	0.4	1.33E+00	9.95E-01

Notes:

1. Road surface silt loading is 0.1 g/m2 for principal arterial type roadways and 0.4 g/m2 for local
2. Average vehicle weight is assumed 6,000 lbs per CEQR Technical Manual
3. Assumed that PM2.5 does not contribute significantly to the annual emission rate.

Bluewater Property Group - MSV1
Town of Florida, New York
Benzene Emission Rates

Table 12a. Benzene Screening

Pollutant	Maximum Emission Rate		Mass Emission Limit (lb/yr)	Exceeds Threshold?
	g/hr	lb/yr		
Benzene	33.49	647	100	Yes

Table 12b. Benzene Emission Rates

Link Group	Sublink Group	Link ID	Benzene Emission Rate ($g/s\text{-}m^2$)		Generic Benzene Conc. (ug/m3)		Adjusted Benzene Conc. (ug/m3)	
			Short-Term	Annual	Short-Term	Annual	Short-Term	Annual

1.0 INTRODUCTION

Ecological Solutions, LLC completed an updated Natural Resources Report for Tax Lot 54.-1-36 containing approximately 137± acres (Site) located on NYS Route 5 in the Town of Florida, Montgomery County New York. The Applicant, BMG Albany, LLC ("BMG"), is proposing to amend an approval granted by the Town of Florida Planning Board for an ecommerce with a footprint of approximately 652,000 square feet ("SF") and 3.2 million SF of gross floor area, respectively, and other related site improvements, including accessory parking for employee vehicles and trucks, stormwater control measures, utility lines, dark-sky compliant lighting, signage and landscaping served by municipal sewer and water services (*Attachment 1*).

This report updates and expands upon an August 22, 2019 Wildlife Habitat Assessment (2019 Report) completed by AECOM for the 1,000,000 SF Warehouse project approved by the Town of Florida Planning Board in December 2019 (Refer to Attachment 2)

The findings of this report is generally consistent with the findings of the 2019 Report and document that habitat, wildlife and threatened and endangered species issues related to site development have remain unchanged between 2019 and the present.

Wetland impacts for the Project required a US Army Corps of Engineers (USACE) Permit for the unavoidable disturbance of 1.9 acres. Mitigation of the wetlands impacts has been provided for the disturbed wetlands as required by the USACE permit and the permit was recently extended. The New York State Department of Environmental Conservation (NYSDEC) has confirmed that the project is not subject to that agency's potential wetlands jurisdiction during a transition period that ends on January 1, 2028.

The data contained in this report was gathered during field visits on March 24, April 4, and April 9, 2025 and totaled about 20 man hours during seasonable weather conditions. Through these site visits the entire site was extensively evaluated. The purpose of the

inventory was to document existing vegetation and habitat cover types, plant species, and wildlife species on the site.

This field investigation supplements the field investigations completed as part of the 2019 Report, which included assessment of wildlife cover mapping, vegetative inventories, and wildlife observation surveys completed by AECOM field ecologists in late Fall of 2018, with a supplementary review in April of 2019.

Additional wildlife species may be located on the site at some time during their life cycle but are most likely transient. There is no species that is supported wholly by the habitats on this site.

2.0 METHODS

2.1 Agency Correspondence/Inquiry

As part of the environmental review for the subject site, Ecological Solutions, LLC, reviewed the Environmental Assessment Form Mapper regarding the status of NYSDEC-designated rare, threatened, or endangered species potentially on the site. No NYSDEC-protected species were identified. The US Fish and Wildlife Service (USFWS) IPaC for threatened and endangered species indicates that there are three Federally species that may be located on or in the vicinity of the site Northern long-eared bat (*Myotis septentrionalis*), tricolored bat (*Perimyotis subflavus)* and the monarch butterfly (*Danaus plexippus*).

The tricolored bat and the monarch butterfly are still proposed for listing, and there was no requirement to consult for these species during the permitting process. No suitable habitat for other State or Federal species was identified during any of the site visits and no such species were observed. No NYSDEC designated “species of special concern” were observed on the site.

2.2 Ecological Community and Habitat Field Inventory

The vegetation inventory included identification of ecological communities or habitat cover types. Cover type surveys were conducted by first reviewing aerial photographs of the site and adjacent properties and subsequently by investigating the habitats on the site to identify and classify each.

Within each cover type, visual searches for herbaceous and woody plant species or parts thereof, including remnants of leaves, bark, twigs, seeds, flowers, fruits, or other identifiable plant structures (seasonally limited) were conducted to identify and document vegetation on the site. Trees, shrubs, and fall flowering plants were identified to species levels where possible based on plant remains. Refer to Attachment 3 – Existing Plant Community Map and Attachment 4 – Site Photographs for the location and representative photographs of the plant communities

2.2.1 Rare Plants

Based on previous field surveys which were conducted during the wetland delineation in May 2019 no federally listed or State listed threatened, endangered, or rare plant species were identified on the site.

2.3 Wildlife Field Inventory

Seasonally limited field surveys were conducted and identified general wildlife species including mammals, birds, and herpetiles (reptiles and amphibians). Methods used are outlined below.

A. **Mammals**. The following survey methods were utilized during the field survey:

1. Sign search, in which the observer records any recognizable signs (tracks, droppings, hair, bones, etc.) of mammal species.
2. Opportunistic mammal sightings, in which the observer identifies mammals encountered in the field at random.

Mammals were identified based on visual encounters, vocalizations, tracks, fur, bones, rubs, scrapes, droppings, and other recognizable signs in habitats throughout the site. Sampling routes were established throughout the site and wildlife was recorded as encountered.

B. **Birds.** Field methods used to survey for avian species included:

1. Walking transects where the observer records all species encountered (seen/heard) along a trail.
2. Opportunistic bird sighting, where the observer records birds encountered randomly.
3. Sign search, where the observer records signs (feathers, old nests, droppings, tracks, etc.) of birds encountered in the field.

C. **Herptiles (Reptiles and Amphibians)**. Field methods used to survey for herptile species included:

1. Log rolling (overturning logs, large stones, and other debris to reveal herptiles underneath).
2. Aural surveys were conducted for vocal herptiles and if found were identified by visual encounter, vocalizations, spermatophores, egg masses, and remains.

3.0 WETLAND IDENTIFICATION

3.1 Wetland Delineation

A Federal wetland delineation was completed on the site in 2019 in accordance with the Routine Delineation Method outlined in the *US Army Corps of Engineers* (USACE) *Wetlands Delineation Manual, Technical Report Y-87-1*[1] and supplement and confirmed by the USACE. Wetland boundaries were field confirmed on April 4, 2025.

There have been no changes to wetland boundaries per the original delineation completed in May 2019.. By email dated March 5, 2025, NYSDEC confirmed that new agency jurisdiction over wetlands, effective January 1, 2025, does not apply to the project during a transitional period ending December 31, 2028.

3.2 Wetland Functional Evaluation

An assessment of wetland functions and values was conducted on the wetland that was identified and delineated on the referenced site. Using a widely accepted method for wetland functions and values assessment developed by the New England District, U.S. Army Corps of Engineers (USACE), 13 distinct wetland functions and values were assessed for the delineated wetlands on the site. This method yielded an objective, descriptive quality index of each wetland rather than a subjective quantified rating of each wetland. This assessment had two major objectives:

1. Objectively identify the functions and values provided by the wetland identified on the site, and
2. Provide baseline data with which the Applicant could work in planning land uses, and against which the Applicant could assess potential impacts of proposed development of the site.

The descriptive quality index of the wetland, based on this methodology, is summarized in this report.

Wetland functions are chemical, physical, and biological processes that wetlands naturally perform, such as absorption of nutrients or floodwaters, or provision of habitat for fish and wildlife. Wetland values are the benefits that society derives from wetland functions, such as flood abatement, or water quality maintenance.

The functions and values assessment was based on the method outlined in *The Highway Methodology Workbook Supplement: Wetland Functions and Values, A Descriptive Approach*, by the *U.S. Army Corps of Engineers New England District*. This method was selected over an arbitrary numeric quantifying assessment scheme because it provides an objective, descriptive approach to functions and values assessment based on professional

[1] (U.S. Army Corps of Engineers Environmental Laboratory, 1987) (1987 Federal Manual)

observation and judgment rather than a simple numeric value rating system. Quantified functions and values assessments do not always provide for descriptive information about wetlands and therefore may overlook important aspects of wetland functions and values.

The Highway Method provides for assessment of each wetland for thirteen defined functions and values. Of these, the first eight are considered wetland functions, and the last five are considered to be wetland values. These are:

1. Groundwater Recharge/Discharge – the potential for a wetland to serve as a recharge area for an aquifer or as a surface discharge point for groundwater.

2. Floodflow Attenuation– A wetland's ability to store and attenuate floodwaters during prolonged precipitation events, thereby reducing or preventing flood damage.

3. Fish and Shellfish Habitat – The ability of permanent or temporary water bodies to provide suitable habitat for fish or shellfish.

4. Sediment/Toxicant/Pathogen Retention – The effectiveness of the wetland in trapping sediments, toxicants or pathogens, thereby protecting water quality.

5. Nutrient Removal/Retention/Transformation – The effectiveness of the wetland at absorbing, retaining, and transforming or binding excess nutrients, thereby protecting water quality.

6. Production Export – The wetland's ability to produce food or usable products for humans or other living organisms.

7. Sediment/Shoreline Stabilization – The wetland's ability to prevent erosion and sedimentation by stabilizing soils along stream banks or the shorelines of water bodies.

8. Wildlife Habitat – The ability of wetlands to provide food, water, cover, or space for wildlife populations typically associated with wetlands or their adjacent areas, both resident and migratory.

9. Recreation – The value placed on a wetland by society for providing consumptive and non-consumptive as well as active or passive recreational opportunities such as canoeing/boating, fishing, hunting, bird/wildlife watching, hiking, etc.

10. Education/Scientific Value – The value placed on a wetland by society for providing subjects for scientific study or research or providing a teaching resource for schools.

11. Uniqueness/Heritage – The value placed on a wetland by society for having unique characteristics such as archaeological or historical value, unusual aesthetic qualities, or unique plants, animals, or geologic features, etc.

12. Visual Quality/Aesthetics – The value placed on a wetland by society for having visual and/or other aesthetic qualities.

13. Threatened or Endangered Species Habitat – The value placed on a wetland by society for effectively harboring or providing habitat for threatened or endangered species.

Findings of the assessment are outlined below:

The wetland area that will be impacted receives water primarily through overland sheet flow and drains off the site to the Route 5S drainage swale system. Hydrological indicators identified within the wetland included soil saturation, watermarks, drift lines, drainage patterns, and water stained leaves.

This wetland is typical of a highly impacted agricultural wetland that has recently been abandoned. The wetland to be impacted is adjacent to Route 5S and two existing residences and cropland to the south. Functions and values provided by these wetlands include floodflow attenuation, sediment trapping, nutrient removal, and wildlife habitat. Of these, the most significant functions based on extent of rationale in identifying functions and values, are floodflow attenuation and sediment trapping (*Attachment*).

Wildlife usage noted in these wetlands is consistent with deer tracks observed in the substrate as well as fox and coyote tracks and other mammals. Common bird species would also utilize the wetland for nesting and foraging as evidenced by nest remains of gold finch and robin. Potential for salamander, wood frogs, green frogs, and other amphibians is limited due to the lack of vernal pool habitat and supporting uplands however the man made pond is habitat for green and bullfrogs.

3.3 Anticipated Impacts to Wetlands

The proposed site development was issued a USACE Permit No. NAN-2019-00679-USH for the permanent filling of 1.9 acres of wetlands. Mitigation required by the USACE for these wetland impacts was completed on August 26, 2020. Refer to the *Statement of Receipt of payment to The Wetland Trust Susquehanna Basin Headwaters and Adjacent Basins In-Lieu Fee Program: Credit Transaction Letter (Attachment 4)*

NYSDEC waived Clean Water Act Water Quality Certification for the wetland impacts covered by the USACE permit due to failure to respond with a reasonable period.

The remaining regulated wetlands on the site will continue to provide the same functional benefits after completion of the proposed development of the site including: maintenance of flood, erosion and storm control; control of pollution and sedimentation; and provision of area for wildlife habitat. will allow the hydrology of the wetland to remain intact. The wetland mitigation area will contribute to any lost wetland function resulting from impacts.

Short-term physical impacts to regulated wetlands on the site will be minimized by the use of erosion controls throughout the site especially in critical areas adjacent to regulated wetlands. No NYSDEC regulated watercourse will be impacted as a result of the proposed development.

3.4 Wetland Mitigation

Mitigation

Wetland mitigation was required by the USACE for the permanent wetland fill associated with the Project. Mitigation required by the USACE for these wetland impacts was completed on August 26, 2020. The current owner or the property, WE Acquisitions LLC, completed the purchase of 2.3 wetland credits form the Wetland Trust for $225,450. Refer to the *Statement of Receipt of payment to The Wetland Trust Susquehanna Basin Headwaters and Adjacent Basins In-Lieu Fee Program: Credit Transaction Letter (Attachment 3)*

Stormwater Measures

A Stormwater Pollution Prevention Plan (SWPPP) prepared by Bohler Engineering details the steps necessary to control stormwater generated on the site as a result of increased impervious surfaces. According to the report, the site has been designed to facilitate stormwater movement and purification especially for salt and sand use on site roads.

Land areas that are not collected by the stormwater management system will sheet flow off the site through natural patterns and surface conditions. The creation of detention basins will function to maintain post-development peak stormwater discharges to at and below their pre-development levels.

The proposed development is designed to integrate the existing runoff patterns and natural features with little disturbance. The natural features on-site will provide environmentally preferred stormwater management mitigation by improving runoff quality through the use of open-channel/wetland filtration, absorption, and evaporation.

The stormwater analysis illustrates that the proposed system will function properly, provide water quality enhancements, and require minimal maintenance to insure continued performance. During construction appropriate soil erosion and sediment control measures will reduce any potential impacts to these regulated resources.

4.0 FINDINGS

4.1 Habitat

There is several distinct dominant cover types identified on the site. Approximate physical impacts to each habitat type are shown and listed in *Table 1* as identified in the project Environmental Assessment Form and as described by (Edinger et al 2014).

Table 1
Habitat Cover Type Impacts

NO.		Acres Identified (Approximate)	Proposed Impacts
1	Mesophytic Forest	20+/-	10
2	Wetland Complex	16.5+/-	1.8
3	Agricultural/Successional Field	100 +/-	95+/-

4.1.1 Terrestrial System

The terrestrial system consists of upland habitats. These habitats have well-drained soils that are dry to mesic (never hydric), and vegetative cover that is never predominantly hydrophytic, even if the soil surface is occasionally or seasonally flooded or saturated. In other words, this is a broadly defined system that includes everything except aquatic, wetland, and subterranean communities.

Mesophytic Forest

This ecological community is composed of hardwood or mixed forest typically on a well-drained soil. The forest canopy may consist of a variety of trees including; quaking aspen (*Populus tremuloides*), red maple (*Acer rubrum*), white ash (*Fraxinus americana*), black cherry (*Prunus serotina*), black birch (*Betula lenta*) and sugar maple (*Acer saccharum*).

This forest segment also has a well-developed shrub layer and species rich herbaceous layer with characteristic species including American hornbeam (*Carpinus caroliniana*), witch hazel (*Hamamelis virginiana*), and vines. Most of the trees are generally in the 4-8 inch dbh range and are in moderate health.

Agricultural/Successional Field

This land use/cover type consists of areas that are actively cultivated to produce crops such as corn, or hayfield. This land use and variable cover type can at times offer moderate wildlife habitat, primarily in the form of seasonally available food sources. The agricultural fields are intermixed with successional fields which are characterized by transitional species with a grasses and shrubs.

4.1.2 Palustrine System

The palustrine system consists of non-tidal, perennial wetlands characterized by emergent vegetation. The system includes wetlands permanently saturated by seepage, permanently flooded wetlands, and wetlands that are seasonally or intermittently flooded (these may be seasonally dry) with vegetative cover that is predominantly hydrophytic with hydric soils. Wetland communities on the site are distinguished by their plant composition (hydrophytes), substrate (hydric soils), and hydrologic regime (frequency of flooding).

Wetland Complex

Wetland habitat consists of areas dominated by wetland shrub species and saplings of wetland tree species to form dense thickets. Depending on the hydrologic regime, these areas may also exhibit some lesser components of upland and/or invasive shrub and non-woody species.

Shrub areas are generally dominated by shrubs such as silky dogwood, gray dogwood (*Cornus racemosa*), Northern arrowwood, black willow, and saplings of red maple (*Acer rubrum*), Eastern cottonwood (*Populus deltoides*), and green ash (*Fraxinus pennsylvanica*),.

Common reed and purple loosestrife are locally abundant and may occur with other species such as willow herb (*Epilobium sp*.), sensitive fern (*Onoclea sensibilis*) and moneywort (*Lysimachia nummularia*). Vines such as poison ivy (*Toxicodendron radicans*) and fox grape (*Vitis labrusca*) are also present at varying densities.

Depending on landscape position, time of year and recent climatological conditions, standing water may or may not be present. These habitat types are generally adjacent to and interspersed with other wetland habitat types and contribute to the site's overall habitat structural diversity and complexity.

Wildlife utilization of these areas observed in 2019 and mostly confirmed in seasonally limited surveys in 2025 includes avian species commonly found in a variety of habitats, including scrub/shrub thickets and includes the black-capped chickadee, tufted titmouse, Northern cardinal, and blue jay, as well as species more typically associated with wetland habitats

such as the red-winged blackbird, common grackle, and great blue heron. Amphibians such as the green frog utilize this habitat type, as well as mammals such as raccoon and white-tailed deer.

4.2 Wildlife

4.2.1 Birds

The following are the birds identified using the site: chickadee, juncos, blue jay, turkey vulture, great blue heron.

4.2.2 Mammals

The following is a list of mammals identified using the site: white tailed deer, red fox, coyote, raccoon.

4.2.3 Herptiles (Reptiles and Amphibians)

There were no herpetiles identified on the site to this point this year:

5.0 POTENTIAL THREATENED/ENDANGERED SPECIES

5.1 Northern long-eared bat (NLEB)

The NLEB typically hibernates in caves/mines in the winter and roosts under bark or in tree crevices in the spring, summer, and fall. Suitable potential summer roosting habitat is characterized by trees (dead, dying, or alive) or snags with exfoliating or defoliating bark, or containing cracks or crevices that could potentially be used by NLEBs as a roost.

The minimum diameter of roost trees observed to date is 2.5 inches for males and 4.3 inches for females. However, maternity colonies generally use trees greater than or equal to 9 inches dbh. Overall, roost tree structure appears to be more important to NLEBs than a particular tree species or habitat type.

Females appear to be more habitat specific than males presumably because of the warmer temperature requirements associated with gestation and rearing of young. As a result, they are generally found at lower elevations than males may be found. Roosts are warmed by direct exposure to solar radiation, thus trees exposed to extended periods of direct sunlight are preferred over those in shaded areas.

However, shaded roosts may be preferred in very hot conditions. As larger trees afford a greater thermal mass for heat retention, they appear to be preferred over smaller trees.

Streams associated with floodplain forests, and impounded water bodies (ponds, wetlands, reservoirs, etc.) where abundant supplies of flying insects are likely found provide preferred foraging habitat for NLEB, some of which may fly up to 2-5 miles from upland roosts on a regular basis. NLEBs also forage within the canopy of upland forests, over clearings with early successional vegetation (*e.g.,* old fields), along the borders of croplands, along wooded fencerows, and over farm ponds in pastures. While NLEBs appear to forage in a wide variety of habitats, they seem to tend to stay fairly close to tree cover.

Conclusion - No hibernacula were observed on the site. Activities during construction will include clearing trees, grading and earth-moving, building construction, addition of electric lights, increasing impervious surface area and altering site drainage. These actions may result in direct and indirect minimal effects on NLEB bats by altering the quality and quantity of the small amount of existing summer habitat on the site (mesophytic forest).

Such alterations include generating noise, generating dust, decreasing water quality, and creating visual disturbances. All of the proposed tree clearing will take place between November 1 and March 31 the time that this species is in hibernation so no individuals of the species will be directly harmed by the site construction. The proposed conservation measures to be employed so that there is no adverse impact to this species include:

- Site lighting will use approved light fixtures that have tops that direct light down to minimize light pollution and which are designed to not interfere with potential bat foraging activities;
- Implementing soil conservation and dust control best management practices, such as watering dry disturbed soil areas to keep dust down, and using staked, recessed silt fence and anti-tracking pads to prevent erosion and sedimentation to surface waters;
- Prior to clearing, the limits of proposed clearing will be clearly demarcated on the site with orange construction fencing (or similar) to prevent inadvertent over clearing of the site, and;
- Stormwater pond/s if required will not be maintained with any chemicals that might adversely affect bats or insect populations on which they may feed.

5.2 Tri-colored bat

As per the NYSDEC Natural Heritage Program "Wooded riparian areas are likely an important foraging habitat for this species during the summer" and they may select roosts in buildings, crevices of cliffs and rocks, or in or below the canopy of live or recently dead trees that retain some dead or live leaves.

Conclusion – Similar to the NLEB the proposed conservation measures to be employed so that there is no adverse impact to this species include:

- Site lighting will use approved light fixtures that have tops that direct light down to minimize light pollution and which are designed to not interfere with potential bat foraging activities;
- Implementing soil conservation and dust control best management practices, such as watering dry disturbed soil areas to keep dust down, and using staked, recessed silt fence and anti-tracking pads to prevent erosion and sedimentation to surface waters;
- Prior to clearing, the limits of proposed clearing will be clearly demarcated on the site with orange construction fencing (or similar) to prevent inadvertent over clearing of the site, and;
- Stormwater pond/s if required will not be maintained with any chemicals that might adversely affect bats or insect populations on which they may feed.

5.3 Monarch butterfly

Monarchs, like all other butterflies and moths, go through egg, larval (caterpillar), chrysalis (pupa), and adult stages. Monarch caterpillars ingest milkweed that contains a toxic compound. The presence of this toxin is used by the monarch butterfly as a defense against predators.

In late August, masses of monarch butterflies begin an epic migration stretching thousands of miles from areas across the United States and as far north as Canada (east of the Rocky Mountains) to overwinter in mountaintops of Central Mexico.

Conclusion – The site is large and contains agricultural lands that are not often utilized by Monarchs which require milkweed plants to lay eggs for the larvae to feed. It is not clear how extensively monarch butterfly could use the site. As a measure to promote use it would be useful to plant/seed milkweed onto the site wherever possible.

6.0 ANTICIPATED IMPACTS

The proposed development and its appurtenant features will necessarily require clearing of upland forest and agricultural land. Earth moving (excavation, filling, and grading), operation of heavy machinery, construction, alteration of existing drainage patterns, addition of impervious surfaces, changes in traffic patterns, and increased human activity will occur on the subject site. Anticipated impacts from these activities are outlined below.

6.1 Impacts to Vegetation and Cover Types

1. **Mesophytic Forest Loss.** The proposed activities will require the removal of approximately 10 acres or 50% percent of this cover type from the site.
2. **Wetland Complex.** Approximately 1.8 acres of impact is associated with the proposed project, which has been authorized by USACE Permit No. NAN-2019-00679-USH
3. **Agricultural/Successional Field**. The proposed activities will result in a net loss of approximately 30 acres, with a large portion of the agricultural field allow to revert to successional fields.

6.2 Impacts to Wildlife

General Direct impacts to wildlife biodiversity from the proposed development will primarily be displacement and some direct loss especially to species that spend a large percentage of their life cycle underground. All of the species found and likely to be found on the site are typically found in this local area and will have already adapted to proximal human habitation. Most species are likely migratory using the site as needed. These species will remain on available lands in the vicinity of the site which will remain connected especially along the Chuctanunda creek.

Threatened/Endangered Species. Please see Section 5.0. No other threatened or endangered species from the USFWS list or identified by the NYSDEC have the potential to be on the site.

7.0 MITIGATION MEASURES

As noted above, mitigation of impacts relating to the wetland filling has been completed as required by USACE Permit No. NAN-2019-00679-USH. In addition, mitigation measures for the potential impacts are outlined below.

7.1 Mitigation for Impacts to Vegetation and Cover Types

The Applicant will minimize impacts by establishing undisturbed, naturally vegetated zones demarcated in the field by orange construction fencing and by clearing only necessary areas within the Limit of Disturbance area.

Native plantings could be useful as part of the site landscaping plan - i.e milkweed.

7.2 Mitigation for Wildlife Impacts

Wildlife displacement from the site will occur since most of the site will be impacted. However, approximately 90 acres or 65% will remain undeveloped and will include a mixture of landscape, wetlands, successional fields and forested areas.

In as much as possible earth moving and tree clearing activities should occur between November1 and March 31 to avoid any direct impacts to NLEBs, tri-colored bats potentially utilizing the site. In addition, no dyes or chemicals should be placed in stormwater detention facilities that could result in wildlife impacts. Fencing (surrounding stormwater basins, atop any retaining walls in excess of 30” in height, etc.) may impede wildlife movements. As mitigation a post and rail style fence should allow wildlife to traverse freely above, below, and through the site fencing.

1.0 Introduction

This report presents a wildlife habitat assessment of an assembly of parcels (the "Site") comprising approximately 160+/- acres along State Highway 5S, west of Mead Road and north of the New York State Thruway (Interstate 90) and an unnamed tributary to Chuctanunda Creek (**Figure 1**) in Florida, Montgomery County, New York.. The site and adjacent lands are primarily in current or former agriculture use, with some of the adjacent areas having been converted to large commercial development and residential subdivisions between 1995 and 2009 (based on inspection of available historic aerial photographs). Blocks of forested and shrub/sapling thickets and old field habitat are also interspersed throughout the area.

AECOM Technical Services, Inc. ("AECOM") performed desktop surveys to collect background information using state GIS and other available databases related to soil conditions, wetland/watercourses, state- and federal-listed species, cover types and wildlife habitats on the Site. Documentation of consultation with the New York Natural Heritage Program ("NYNHP", October 2, 2018) and the United State Fish and Wildlife Service ("USFWS") Information for Planning and Consultation system ("IPaC", August 13, 2018) is included herein as **Attachment A**.

AECOM also reviewed available site mapping and proposed site plans to ensure field efforts would be directed at appropriate locations based upon initial cover mapping of habitat conditions. Field investigations that included cover mapping, vegetative inventories, and wildlife observation surveys were carried out by AECOM field ecologists in late Fall of 2018, with a supplementary review in April of 2019.

2.0 Site Description

This section identifies wildlife resources that currently exist at the Site. The objective is to identify and describe the Site's existing wildlife habitat/ecological resources and evaluate these resources in the context of the surrounding landscape.

2.1 Description of Wildlife Habitat Cover Types

This wildlife habitat assessment identified existing habitat cover types and land uses on the site with the objective of identifying ecological resources in the context of the surrounding landscape. For classification purposes, the Site and surrounding areas are divided into ecological communities per the New York Natural Heritage Program (NYNHP) Classes (Edinger *et al.*, 2014) as indicated below. Numbers in parentheses after each ecological community type and/or land use/cover type represent the approximate acreage of each habitat on the Site. **Figure 2** identifies the location of each community/habitat type on an aerial photograph base map.

NYNHP Classes for Upland Areas:

- VI(A)30 Successional Old Field, (2.9 acres)
- VI(A)31 Successional Shrubland, (9.9 acres)
- VI(C)16 Rich Mesophytic Forest, (12.1 acres)
- VI(C)26 Successional Northern Hardwood Forest, (1.4 acres)

- VI(D)1 Crop land, row crops, (98.9 acres)
- VI(D)2 Crop land, field crops, (9.2 acres)
- VI(D)11,12 Residential, (includes buildings, lawn and areas of impervious surfaces (8.9 acres)

NYNHP Classes for Wetland Areas:

- V(A)2 Shallow Emergent Marsh, (0.2 acres)
- V(A)3 Shrub Swamp, (0.5 acres)
- Mixed Emergent/Shrub Swamp (12.3 acres)
- V(C)2 Red Maple-Hardwood Swamp (PFO), (3.0 acres)

NYNHP Classes for Riverine Areas

- III(A)3 Rocky Headwater Stream, (4,356 linear feet)

NYNHP Classes for Lacustrine Areas

- IV(B)5 Farm Pond/Artificial Pond, (0.4)

2.1.1 Upland Habitat Descriptions

As identified above, upland habitats on the Site are predominantly composed of active agricultural fields, fallow, successional old field habitat, successional shrubland and northern hardwood forest and rich mesophytic forest. Peripheral residential and riprap erosion control roadside areas also occur along Route 5S. A brief description of each ecological community and/or cover type is presented below. **Table 1** provides observed wildlife for habitat types described below, with the exception of Residential Areas, which is treated separately, and provides a list of wildlife which may potentially utilize these habitats based upon existing conditions.

Successional Old Field

This ecological community is defined as meadow habitat dominated by forbes and grasses that occurs on sites that have been cleared and plowed for farming or other development and then abandoned. Shrubs may be present, but collectively they have less than 50% cover in the community. This is a relatively short-lived community that succeeds to a shrubland, woodland, or forest community. This community may provide habitat for a variety of butterflies, birds typically associated with field and shrub communities, and small mammals. Examples from Edinger et. al., 2014 include black swallowtail, field sparrow, and meadow vole.

Successional Shrubland

This type of habitat occurs as successional old field habitats advanced in age and growth. Successional shrubland is similar to successional old field with the added development of shrub and sapling growth which dominates at least half of its aerial extent. The two habitats (i.e., successional old field and successional shrubland) are often found proximal to and interspersed with each other. This habitat is frequented by a number of bird species including gray catbird, brown thrasher eastern towhee, and song sparrow (Edinger et. al., 2014).

Rich Mesophytic Forest

This ecological community is composed of hardwood or mixed forest typically on a mineral rich, fine textured, well-drained soil. The forest canopy may consist of a variety of trees including; red oak (*Quercus rubra*), red maple (*Acer rubrum*), white ash (*Fraxinus americana*), American beech (*Fagus grandifolia*), black cherry (*Prunus serotina*), black birch (*Betula lenta*) and sugar maple (*Acer saccharum*). This forest also has a well-developed shrub layer and species rich herbaceous layer with characteristic species including American hornbeam (*Carpinus caroliniana*), maple-leaf viburnum (*Viburnum acerifolium*), witch hazel (*Hamamelis virginiana*), interrupted fern (*Osmunda claytoniana*), white baneberry (*Actaea pachypoda*), and early meadow rue (*Thalictrum dioicum*).

Successional Northern Hardwood Forest

This forest is a hardwood or mixed forest that occurs on sites that have been cleared or similarly disturbed. Codominant canopy species may include any of the following trees; quaking aspen (*Populus tremuloides*), big-toothed aspen (*P. grandidentata*), balsam poplar (*P. balsamifera),* paper birch (*Betula papyrifera*), gray birch (*Betula populifolia*), pin cherry (*Prunus pensylvanica*), black cherry and white pine (*Pinus strobus*), with lesser amounts of white ash, green ash (*Fraxinus pennsylvanica*), and American elm (*Ulmus americana*).

Cropland Row Crops

This land use/cover type consists of areas that are actively cultivated to produce crops such as corn, potatoes and soybeans or similar crops. This land use and variable cover type can at times offer moderate wildlife habitat, primarily in the form of seasonally available food sources.

Cropland Field Crops

This land use/cover type consists of areas that are actively cultivated to produce crops such as alfalfa, Timothy, oats and wheat and includes areas that are periodically rotated to pasture lands. This land use and variable cover type can at times offer moderate wildlife habitat, in the form of seasonally available food sources and limited cover. Both cropland categories are created and/or maintained by human activities such that exiting soils and vegetation are substantially different than the character of what occurred prior to manipulation by humans. Characteristic birds with varying abundance may include grasshopper sparrow, vesper sparrow, bobolink, and mourning dove (Edinger et. al., 2014).

Residential Areas

Residential areas are defined as mowed lawn with trees and residential buildings and support structures. This land use offers limited wildlife habitat value. Wildlife occurring in these upland areas are expected to be those typical of urbanized environments with high human disturbance, fragmented forest, and open fields of upstate New York. Typical wildlife species would include:

- **Birds**: American robin (*Turdus migratorious)*, mockingbird (*Mimus polyglottus*), mourning dove(*Zenaida macroura*), rock dove (*Colubia livia*), killdeer (*Chardrius vociferous*), European starling (*Sturnus vulgaris*) and house sparrow (*Passer domesticus*); and

- **Mammals**: Whitefooted mouse (*Peromyscus leucopus*), deer mouse (*Peromyscus maniculatus*), meadow vole (*Microtus pennsylvanicus*), grey squirrel (*Sciurus carolinensis*), Eastern chipmunk (*Tamias striatus*), Eastern cottontail (*Sylvilagus floridanus*), raccoon

(*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), red fox (Vulpes vulpes), coyote (*Canis latrans*), striped skunk (*Mephitis mephitis*) and white-tailed deer (*Odocoileus virginianus*).

2.1.2 Wetland Habitat Descriptions

This section provides a physical description of the wetland habitats as generally defined for the purposes of habitat cover mapping. **Table 1** also provides a list of observed wildlife and wildlife species which may potentially utilize these habitats based upon the conditions present.

Shallow Emergent Marsh

Palustrine emergent shallow marsh (PEM) habitats occur in areas with saturated soils and include areas of standing water to a depth of up to approximately three feet for some portion of the year. These hydrological conditions will vary seasonally and are also dependent on recent climatological conditions and biological factors, including the North American beaver, whose activity levels will vary over time based upon food resource availability. Small areas of water colonized by aquatic plants are included within the deeper portions of this habitat type and provide resources for reptiles, amphibians, fish and aquatic invertebrates.

Dominant herbaceous plant species within this habitat type include common reed (*Phragmites australis*), common cattail (*Typha latifolia*), soft rush (*Juncus effusus*), wool grass (*Scirpus cyperinus*), purple loosestrife (*Lythrum salicaria*), water horehound (*Lycopus americanus*), beggar-ticks (*Bidens frondosa*), smartweeds (*Polygonum spp.*), grass-leaved goldenrod (*Euthamia graminifolia*) and rough-stemmed goldenrod (*Solidago rugosa*). Patches of wetland shrubs and/or small trees such as black willow (*Salix nigra*), silky dogwood (*Cornus amomum*), and Northern arrowwood (*Viburnum dentatum*) are found along the margins and within this habitat type and reflect the wide range of growing conditions present.

Avian species observed in these habitats include wading birds such as green heron and great blue heron, waterfowl such as Canada goose, mallard, green-winged teal, blue-winged teal, pied-billed grebe and other species including osprey, belted kingfisher, Eastern kingbird, red-winged blackbird, swamp sparrow and common grackle. Amphibians and reptiles observed within this habitat include the spring peeper, green frog, Northern leopard frog and painted turtle. Sign of the North American beaver, raccoon, muskrat and white-tailed deer were also observed.

Palustrine Shrub Swamp

Palustrine scrub shrub/shrub swamp (PSS) habitats consist of areas dominated by wetland shrub species and saplings of wetland tree species combined with various lianas to form dense thickets. Depending on the hydrologic regime, these areas may also exhibit some lesser components of upland and/or invasive shrub and non-woody species. Areas of PSS are generally dominated by shrubs such as silky dogwood, gray dogwood (*Cornus racemosa*), Northern arrowwood, black willow, honeysuckle (*Lonicera spp.*) and common buckthorn (*Rhamnus cathartica*), and saplings of red maple (*Acer rubrum*), silver maple (*Acer saccharinum*), Eastern cottonwood (*Populus deltoides*), green ash (*Fraxinus pennsylvanica*), black ash (*Fraxinus nigra*) and pin oak (*Quercus palustris*). Common reed and purple loosestrife are locally abundant and may occur with other species such as willow herb (*Epilobium sp.*), sensitive fern (*Onoclea sensibilis*) and moneywort (*Lysimachia nummularia*). Vines such as poison ivy (*Toxicodendron radicans*) and fox grape (*Vitis labrusca*) are also present at varying densities. Depending on landscape position, time of year and recent climatological conditions, standing water may or may not be present. These habitat types are generally adjacent to and

interspersed with other habitat types (PFO/PEM) and contribute to the site's overall habitat structural diversity and complexity.

Wildlife utilization of these areas includes avian species commonly found in a variety of habitats, including scrub/shrub thickets and includes the black-capped chickadee, tufted titmouse, Northern cardinal, and blue jay, as well as species more typically associated with wetland habitats such as the red-winged blackbird, common grackle, swamp sparrow, green heron and great blue heron. Amphibians such as the Northern leopard frog, green frog and spring peepers may utilize this habitat type, as well as mammals such as raccoon, muskrat, beaver and white-tailed deer. Other species likely to occur within this habitat type are indicated in **Table 1**.

Palustrine Forested Wetland

Palustrine forested wetlands (PFO) on the site are dominated by tree species such as red maple, silver maple, Eastern cottonwood, green ash, black ash, willow (Salix Sp.), American sycamore (*Platanus occidentalis*), slippery elm (*Ulmus rubra*) and pin oak. The forest canopy is subtended by an understory consisting of saplings of these tree species as well as shrubs such as silky dogwood, gray dogwood, black willow, Northern arrowwood, honeysuckle and common buckthorn. Overall canopy coverage varies and in forest openings, where sufficient light penetrates to the forest floor, herbaceous plants such as sedges (*Carex spp.*), rushes (*Juncus spp.*) and forbes such as asters (*Aster spp.*), goldenrods (*Solidago spp.*), purple loosestrife, moneywort, willow herb and sensitive fern can be found. Vines such as poison ivy (*Toxicodendron radicans*) and fox grape (*Vitis labrusca*) may also be present at varying densities.

Surface water/hydrology conditions vary and include areas of sustained standing water, perennial and intermittent stream channels, as well as areas which appear to be saturated for prolonged periods, and areas with little or no evidence of standing water. Plant community composition and structure are strongly influenced by these varying hydrological conditions.

Wildlife utilization of this habitat type is largely dependent on and in response to the variability in plant communities and the wide variety of plant species and hydrological conditions results in the presence of a wide range of animal species. Mammals such as North American beaver, white-tailed deer, raccoon, and gray squirrel, amphibians such as the green frog and Northern leopard frog, and avian species such as Baltimore oriole, Northern cardinal, hairy woodpecker, downy woodpecker and other species can be expected to use this habitat type.

2.1.3 Aquatic Habitat Areas

Aquatic habitats on the Site are limited to two farm ponds and the unnamed tributary to Chuctanunda Creek.

Farm Pond/Artificial Pond

These small aquatic habitats are constructed in agricultural or residential areas and typically lack perennially flowing inlets or outlets. Observed biota is limited and may reflect those species which naturally colonized them, as well as those intentionally seeded. Fish such as sunfish (*Lepomis spp.*), yellow perch (*Perca flavescens*) and largemouth bass (*Micropterus salmoides*) are commonly found in these habitats along with painted turtle (*Chrysemys picta*), green frog (*Rana clamitans*) and other common reptiles and amphibians. Mammals such as muskrat (*Ondatra zibethicus*) and beaver are likewise found colonizing these habitats, especially when additional lentic and lotic aquatic habitats are found close by.

Rocky Headwater Stream

The unnamed tributary to Chuctanunda Creek is a small, shallow, perennial stream with moderate to steep gradient. Water flows over eroded bedrock, boulders, cobbles, gravel and sand and alternating sequences of riffles, runs and pools are present. Fish commonly observed in these habitats include dace (*Rhinichthys spp*.), creek chub (*Semotilus atromaculatus*), common shiner (*Luxilus cornutus*), sculpins (*Cottus spp*.), and white sucker (*Catostomus commersonii*). A robust aquatic macroinvertebrate community is also commonly observed in these habitats and includes species such as caddisfly (*Trichoptera*), stonefly (*Plecoptera*), mayfly (*Ephemoptera*), chironomid midges, and crayfish (*Cambaridae*).

2.1.4 Expected and/or Observed State and Federal-Listed Species

AECOM has reviewed available data regarding state- and federal-listed species on the site. Before requesting a Natural Heritage review, the New York State Natural Heritage Program ("NYNHP") recommends consulting its Environmental Resource Mapper. If a project site does not fall within an area displayed in the Rare Plants and Rare Animals layer, then NYNHP has no records to report and there is no need to submit a request for a project screening. Database consultation determined that NYNHP has no records of state-listed species on or proximal to this site; therefore a request for project screening was not submitted. Results from the Environmental Resource Mapper for the Site is included in **Attachment A**.

As a result of consulting the USFWS Information for Planning and Consultation ("IPaC") system (August 13, 2019), one federal-listed species was indicated as potentially utilizing the Site, the Northern long-eared bat (*Myotis septentrionalis*). A copy of the IPaC species list generated for the Site is also included in **Attachment A**.

3.0 Summary

This report presents an overview of existing and potential wildlife habitat on the 160+/- acre Site. The habitat assessment demonstrates that the species and habitats found in on the Site are typical of those expected to be found, and are not high quality or particularly sensitive habitats. Habitats identified are minimally ranked as apparently secure within New York State. NYNHP had no records of state-listed animals or plants, significant natural communities or other significant habitats on or in the immediate vicinity of the Site. The USFWS IPaC system indicated one federal-listed species may utilize the site, the Northern long-eared bat.

The more significant habitat identified on the Site is clearly the riparian habitat along the un-named tributary to Chuctanunda Creek in the southern tier of the Site. The aquatic habitat of the creek along a diverse riparian habitat of shrub and more mature wooded cover provide functional habitat for a wide range of invertebrate and vertebrate wildlife species, and the riparian corridor effect connecting to Chuctanunda Creek enhances the connectivity of this habitat to a broader vicinity beyond the Site limits. While the remainder of the Site is open space with scattered woodland habitat, it is subjected to current and past land uses which limit the habitat conditions and associated functions. As proposed, the development of the site largely retains the functional connectivity and integrity of the riparian corridor along the tributary stream, and restricts the development to the more disturbed portions of the site. It will be important during construction to control any access into the southern riparian zone and to control erosion and sediment from the construction zone to avoid impairment of

the riparian corridor. Soil stabilization and landscaping along the southern limits of the proposed development should be emphasized to buffer the effects of the development from this riparian habitat.

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). This list can also be used to determine whether listed species may be present for projects without federal agency involvement. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list.

Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the ESA, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC site at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list. If listed, proposed, or candidate species were identified as potentially occurring in the project area, coordination with our office is encouraged. Information on the steps involved with assessing potential impacts from projects can be found at: http://www.fws.gov/northeast/nyfo/es/section7.htm

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/

eagle_guidance.html). Additionally, wind energy projects should follow the Services wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the ESA. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

New York Ecological Services Field Office

Endangered Species Act Species

There is a total of 1 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

k. Photo Simulations

I. Visual Impact Assessment Overview

This assessment has been conducted to review the visual impact of the proposed development from the surrounding area. The assessment included the following components: a review of the project vicinity to understand existing conditions and land uses, a review of previously prepared plans and exhibits from past application(s), and a review of current application site plans. Based on the current site plans the assessment included the development of exhibit cross sections and photo simulations to illustrate proposed conditions. The assessment utilized publicly available data including aerial mapping and topographic LIDAR survey.

Project Location

The project site area is 139 acres located along Route 5S in the Town of Florida, Montgomery County, New York. Bordered to the north by State Route 52, to the east by Mead Road, to the south by Interstate 90 and to the west by an existing industrial distribution facility.

Zoning

The project site is located within the Commercial / Light Industrial Zone (C-2) and the proposed industrial use is permitted.

Development Summary – Current Application

The proposed project includes the construction of a multi-story industrial facility with associated access drives, trailer loading & parking areas, and car parking areas. The proposed industrial building footprint is 652,060 square feet with a total building height of 100 feet above grade.

II. Project Vicinity

Land Use

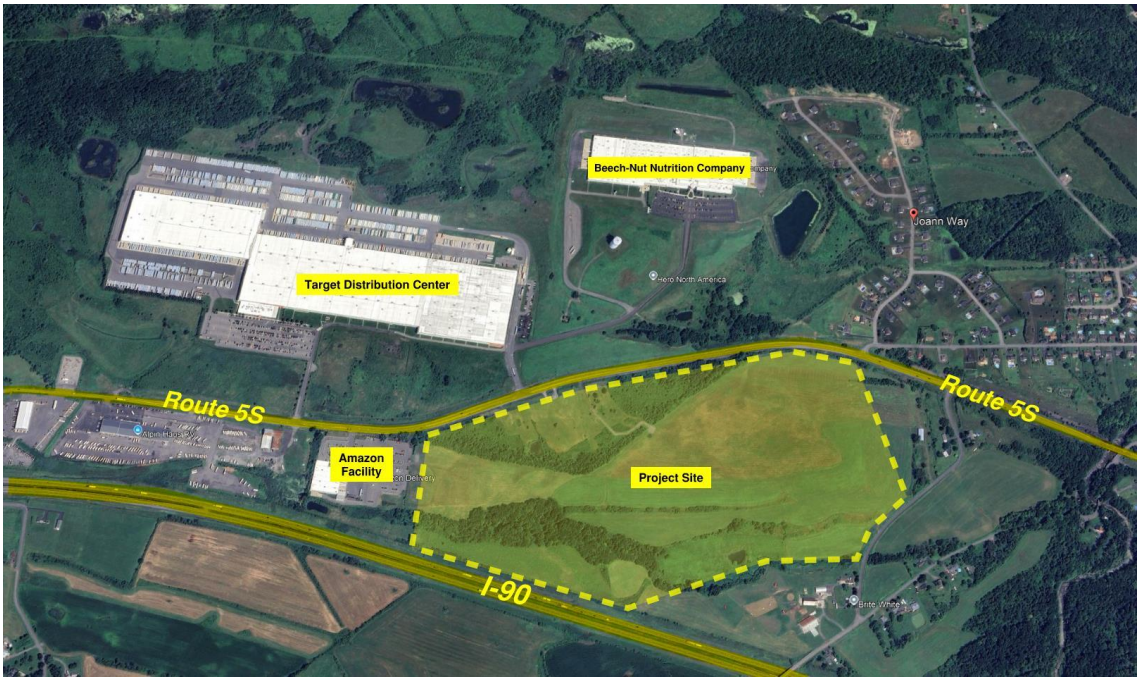
As shown on the Town of Florida Zoning Map, the subject property is surrounded by the following land uses:

- South of I-90: Agriculture Zoned Land primarily composed of residential & farming use with some parcels operating commercial and service type uses
- North of I-90: The subject property is directly surrounded by multiple large industrial distribution uses including Amazon, Target and Beech-Nut

Nutrition facilities. The subject property also is adjacent to a residential neighborhood to the northeast including Broadway Extended and Joann Way roads.

Community Sensitive Receptor Locations

Multiple locations surrounding the subject property have been identified as 'Community Sensitive Receptors' with input from the local municipality. These locations were identified as areas of potential concern with regards to visual impact. The following Community Sensitive Receptors are listed based on their distance from the subject property (closest listed first, furthest listed last):



1. Broadway Extension (residential neighborhood)
2. Joann Way (residential neighborhood)
3. William Barkley Elementary School (1.0 miles away)
4. New York Route 30 Viewshed (1.5 miles away)
5. Mohawk River Pedestrian Bridge (1.5 miles away)
6. Memorial Park & Town Baseball Field (3.0 miles away)
7. Chuctanunda Cemetery (4.0 miles away)

Existing Viewshed Conditions

The existing landscape surrounding the project site consists of I-90 & Route 5S corridors, multiple industrial facilities, a residential neighborhood to the northeast and residential properties to the east. Viewshed impact into the site from the north, west and south will be limited based on the similar industrial uses and roadway corridors surrounding the site.

Viewshed impact into the site from the northeast (residential neighborhood) and to the east from residential properties shall be mitigated and proposed conditions are illustrated with the current application cross sections and photo simulations included within this study. The existing viewshed from the residential neighborhood is currently visually impacted by the Route 5S corridor, multiple industrial facilities and an existing Town of Florida water tower, 50 feet in height, located directly to the north of the subject site.

The site is not located within a designated scenic vista or viewshed area including Scenic Areas of Statewide Significance (SASS) or National Scenic Byways.

Aerial map, project vicinity

III. Previously Approved Project

A site plan for the subject property was previously approved and included a 1.0M SF footprint warehouse with associated access drives, trailer loading and parking areas, and car parking areas. The proposed building was orientated parallel to Route 5S with a proposed minimum front yard setback of 94 feet. Trailer access, loading and parking was located on all sides of the building including within the front yard along Route 5S.

As part of the previously approved site plan application, a landscape plan was included that featured more than 100 trees located between the proposed development and the residential neighborhood to the northeast, one of the identified sensitive receptors in the surrounding area. The proposed trees were a mix of deciduous and evergreen species to provide buffering and screening of the proposed industrial development.

Visual Simulations (Previous)

Visual Simulations including illustrative cross sections and photo simulations were included with the previous approved application to portray proposed conditions of the development. The included visual simulations depicted the conditions between the residential neighborhood to the northeast and the subject property.

IV. Proposed Conditions – Current Application

The current site plan includes a multi-story industrial facility with associated access drives, trailer loading & parking areas, and car parking areas. The proposed industrial building footprint is 652,060 square feet with a total building height of 100 feet above grade. The proposed building is located along Route 5S and includes a minimum 200 foot front yard building setback.

The current landscape plan includes more than 300 proposed evergreen and deciduous trees located to provide screening from adjacent land uses. The trees are located throughout the front yard and parking areas of the site to provide visual softening of the vehicular areas and the building. The proposed trees have been located at higher proposed elevations on the site to maximum the screening benefit.

In comparison to the previously approved site plan, there are multiple noteworthy differences that affect the visual impact of the proposed development:

- **Reduction in building footprint.** The current site plan includes a 652K SF footprint as compared to the previously approved 1M SF footprint.

- **Increase in building height.** The current application includes a maximum building height of 100 feet as compared to the lower max height in the previously approved site plan. The site is located within the C-2 zone which does not include a maximum building height requirement.

- **Lowering of first floor elevation.** To mitigate visual impact of the proposed building height, the current site plan has lowered the first floor elevation of the proposed building.

- **Increase in proposed landscape & screening.** To enhance the site and provide buffering and screening of the proposed development from adjacent sensitive receptors, the proposed landscape plan includes larger quantities of proposed trees. The current landscape plan includes more than 300 deciduous and evergreen trees located between the proposed development and the residential neighborhood to the northeast, as compared to the 100 trees included in the previous site plan application.

- **Increased distance of proposed trailer parking from residential neighborhood.** The previously approved site plan application included

proposed trailer parking within 100 feet of the residential neighborhood to the northeast of the project site. In the current application, the truck parking area has been relocated to the western side of the project site adjacent to similar adjacent land uses.

Visual Simulations (Current)

The current site plan application includes illustrative cross sections and photo simulations to portray proposed conditions of the project as they relate to the identified community sensitive receptor locations. The illustrations include proposed site elements consisting of the building, drive aisles and parking areas, and landscape screening blended with existing conditions.

The illustrative cross sections depict existing and proposed elevations of the project development and surrounding location identified below.

1. View from Joann Way & Broadway Extended (residential neighborhood)
   Summary of Visual Impact: The closest home within the Joann Way residential neighborhood is approximately 1/4 mile distance from the closest corner of the proposed building. The residential neighborhood is approximately 50 feet lower in elevation compared to the first floor elevation of the proposed building. With the neighborhood lower in elevation than the proposed site, the proposed landscape trees will greatly impact the visual of the northern and eastern sides of the site and building façade.

2. View from Pedestrian Bridge
   Summary of Visual Impact: The Mohawk Valley Gateway Overlook Pedestrian Bridge is approximately 1.5 miles distance from the proposed building. The pedestrian bridge is more than 200 feet lower in elevation than the first floor elevation of the proposed building. For reference, the existing water tower located in close proximity to the proposed site is not visible from the pedestrian bridge viewshed. Based on topography, land form and existing vegetation between the pedestrian bridge and the project site (as shown on the cross section exhibits) no visual impact is anticipated from this community location.

3. View from School
   Summary of Visual Impact: The William Barkley Elementary School is approximately 1.0 miles distance from the proposed building. The school is approximately 100 feet lower in elevation than the first floor elevation of

the proposed building. There exists a mature stand of existing trees more than 1,000 feet in width located between the school and State Route 5S. Based on this large existing forested area and the distance to the proposed site, no visual impact is anticipated from this community location.

4. View from Route 30
   Summary of Visual Impact: A location along Route 30 as identified in the map figures is approximately 1.5 miles distance from the proposed building. In this location Route 30 is approximately 50 feet higher in elevation than the first floor elevation of the proposed building. This viewshed includes existing farmland in the foreground as well as existing industrial uses and the existing water tower (adjacent to the site) in the distant background. The visual impact is minimized from this location as the proposed building will be located in the distant background among other existing industrial land uses in the area.

The Photo Simulations include 'before' and simulated 'after' construction imagery of the project development from the views identified below. The simulations include multiple growth periods for the proposed landscape trees including 1-year 5-years and 10-years. This is intended to provide a more accurate depiction of the proposed screening after installation and the visual impact the landscape trees will have from surrounding areas.

1. View from Joann Way (residential neighborhood)
2. View from Broadway Extended (residential neighborhood)
3. View from Route 30

Visual Impact Summary

As outlined and described above, the visual impact of the current application has been reviewed to evaluate the viewshed impact within the vicinity of the project site. The current application has made significant efforts to reduce visual impact of the site by reducing the building footprint compared to the previously approved application and locating truck parking areas further from adjacent residential zones. In addition to these measures, significant landscape improvements are proposed for the purposes of visual mitigation to surrounding land uses.

REVISION 1 - 1/28/2025

THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE LOCATION OF ALL UTILITIES AND STRUCTURES, WHETHER SHOWN ON THESE PLANS OR NOT, AND SHALL TAKE ALL PRECAUTIONS NECESSARY TO PROTECT THEM DURING CONSTRUCTION. IN THE STATE OF NEW YORK, SECTION 220-D OF THE LABOR LAW REQUIRES THAT ANY PERSON, FIRM OR CORPORATION PERFORMING EXCAVATION SHALL NOTIFY ALL UTILITIES HAVING INSTALLATIONS IN THE AREA OF THE PROPOSED EXCAVATION AT LEAST 10 BUT NOT MORE THAN 30 WORKING DAYS PRIOR TO COMMENCEMENT OF EXCAVATION. FAILURE TO DO SO COULD RESULT IN THE CONTRACTOR BEING HELD LIABLE FOR ANY DAMAGE TO UTILITIES OR STRUCTURES. THE CONTRACTOR SHALL ALSO BE RESPONSIBLE FOR NOTIFYING ANY UTILITIES NOT PARTICIPATING IN THE ONE CALL SYSTEM. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ANY DAMAGE TO UTILITIES OR STRUCTURES. THE CONTRACTOR SHALL BE RESPONSIBLE FOR NOTIFYING ANY UTILITIES NOT PARTICIPATING IN THE ONE CALL SYSTEM. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ANY DAMAGE TO UTILITIES OR STRUCTURES.

TOWN OF FLORIDA LANDSCAPE REQUIREMENTS

SECTION	REQUIREMENTS	CALCULATIONS/PROPOSED
SECTION 37:	A. WHERE ANY PERMITTED NON-RESIDENTIAL LAND USE ABUTS AN EXISTING RESIDENTIAL PARCEL OR VACANT PARCEL WHERE RESIDENTIAL DEVELOPMENT COULD OCCUR, A LANDSCAPE STRIP AT LEAST 20' WIDE SHALL BE MAINTAINED AS A LANDSCAPED AREA IN THE FRONT, SIDE AND/OR REAR YARD WHICH ADJOIN THESE USES.	PROVIDED
	B. ALL LANDSCAPING SHALL BE MINIMUM OF 4' IN HEIGHT	PROVIDED

OWNER MAINTENANCE RESPONSIBILITIES

UPON OWNER'S (OR OWNER CONTRACTOR'S) COMPLETION OF LANDSCAPING WORK, THE OWNER IS FULLY RESPONSIBLE FOR ALL FUTURE MAINTENANCE, CARE, UPKEEP, WATERING, AND TRIMMING OF ALL INSTALLED VEGETATION, PLANTS, TREE, BUSHES, SHRUBS, GRASSES, GRASS, ORNAMENTAL PLANTS AND FLOWERS, FLOWERS, GROUND COVER, AND LANDSCAPING, INCLUDING ALL LANDSCAPE ISLANDS AND AREAS ADJACENT OR PART OF THE LANDSCAPED AREAS. THIS RESPONSIBILITY INCLUDES, BUT IS NOT LIMITED TO, THE FOLLOWING:

- TREES ADJACENT TO WALKWAYS AND AREAS OF PEDESTRIAN TRAFFIC MUST BE MAINTAINED TO ASSURE THAT ANY BRANCHES MUST BE LIMBED UP TO A CLEARANCE HEIGHT OF 7 FT. (FROM ALL PEDESTRIAN SURFACES) OR PRUNED BACK TO AVOID ANY INTERFERENCE WITH THE TYPICAL PATH OF TRAVEL.
- TREES WITHIN VEHICULAR SIGHT LINES, AS ILLUSTRATED ON THE LANDSCAPE PLAN, ARE TO BE TRIMMED TO A CLEARANCE HEIGHT OF 7 FT. (FROM ALL PAVED, TRAVELED SURFACES), OR AS OTHERWISE INDICATED ON THE PLANS.
- VEGETATIVE GROUND COVER, SHRUBS AND ORNAMENTAL PLANTS AND GRASSES MUST BE TRIMMED SO THAT NO PORTION OF THE PLANT EXCEEDS 30 INCHES ABOVE GRADE (OF ALL PAVED, TRAVEL SURFACES) ALONG AND WITHIN THE SIGHT LINES OF PARKING LOTS AND INGRESS-EGRESS WAYS.
- FALLEN PLANT FLOWERS, FRUIT, SEEDS AND DEBRIS DROPPINGS ARE TO BE REMOVED IMMEDIATELY FROM VEHICULAR AND PEDESTRIAN TRAFFIC AREAS TO PREVENT TRIPPING, SLIPPING OR ANY OTHER HAZARDS.

THESE REQUIREMENTS DO NOT AFFECT THE PLANT LIFE GUARANTEES THE LANDSCAPE CONTRACTOR IS REQUIRED TO PROVIDE.

THIS PLAN TO BE UTILIZED FOR LANDSCAPE PURPOSES ONLY

TOWN OF FLORIDA, NEW YORK
LANDSCAPE REQUIREMENTS

SECTION	REQUIREMENT	PROPOSED
§SECTION 15 - WALLS, FENCES AND HEDGES	D. YARD REQUIREMENTS 1. A FENCE, WALL OR HEDGE SHALL BE NO CLOSER THAN TWO (2) FEET FROM THE FRONT LOT LINE, AND SHALL PROVIDE NECESSARY VISIBILITY ON CORNER LOTS. 2. A FENCE, WALL OR HEDGE SHALL BE NO CLOSER THAN TWO (2) FEET FROM ANY SIDE OR REAR YARD PROPERTY LINE, PROVIDING A STRIP OF LAND ON EACH SIDE OF THE PROPERTY LINE FOR ABUTTING PROPERTY OWNERS TO MAINTAIN THEIR FENCE WITHOUT TRESPASSING ON THE LANDS OF THE ABUTTING PROPERTY OWNER.	PROVIDED.
§SECTION 37 - LANDSCAPING REQUIREMENTS	A. WHERE ANY PERMITTED NON-RESIDENTIAL LAND USE, MULTIPLE-FAMILY DEVELOPMENT OR MOBILE HOME PARK ABUTS AN EXISTING RESIDENTIAL PARCEL OR VACANT PARCEL WHERE RESIDENTIAL DEVELOPMENT COULD OCCUR, A STRIP OF LAND AT LEAST 20 FEET WIDE SHALL BE MAINTAINED AS A LANDSCAPED AREA IN THE FRONT, SIDE AND/OR REAR YARD WHICH ADJOIN THESE USES. B. REQUIRED LANDSCAPING SHALL BE INSTALLED AND MAINTAINED IN A HEALTHY GROWING CONDITION AND SHALL TAKE THE FORM OF ANY OR ALL OF THE FOLLOWING: SHADE TREES, DECIDUOUS SHRUBS, EVERGREENS, WELL-KEPT GRASSED AREAS OR GROUND COVER. IN ANY CASE, ALL SUCH LANDSCAPING SHALL BE A MINIMUM OF FOUR (4) FEET IN HEIGHT.	PROVIDED. MIN. 20 FEET LANDSCAPE STRIP WITHIN FRONT YARD

Re: USACE
MSV1 – Amazon Warehouse/Distribution Facility
Route 5S, Town of Florida, Montgomery County, NY
25PR01056

Dear Jed Sarabia:

Thank you for requesting the comments of the State Historic Preservation Office (SHPO). We have reviewed the project in accordance with Section 106 of the National Historic Preservation Act of 1966. These comments are those of the SHPO and relate only to Historic/Cultural resources. They do not include potential environmental impacts to New York State Parkland that may be involved in or near your project.

Based upon this review, it is the opinion of the New York SHPO that no historic properties, including archaeological and/or historic resources, will be affected by this undertaking.

If further correspondence is required regarding this project, please be sure to refer to the OPRHP Project Review (PR) number noted above. If you have any questions, please contact Josalyn Ferguson at the following email address:

Josalyn.Ferguson@parks.ny.gov

Sincerely,

R. Daniel Mackay

Deputy State Historic Preservation Officer
Division for Historic Preservation

Re: USACE
Winstanley Distribution Center / Interchange 27 Warehouse
NYS Route 5S and Mead Road, Florida, NY
19PR04728
NAN-2019-00679-USH

Dear Mr. Sherwood:

Thank you for requesting the comments of the New York State Historic Preservation Office (SHPO). We have reviewed the submitted materials in accordance with Section 106 of the National Historic Preservation Act of 1966. These comments are those of the SHPO and relate only to Historic/Cultural resources. They do not include other environmental impacts to New York State Parkland that may be involved in or near your project. Such impacts must be considered as part of the environmental review of the project pursuant to the National Environmental Policy Act and/or the State Environmental Quality Review Act (New York State Environmental Conservation Law Article 8).

We have reviewed the report entitled “Phase III Data Retrieval, Winstanley Distribution Center, J. Houck Historic Site (05704.000188)” (SHPO Report No. 22SR00426), as well as the accompanying materials demonstrating adherence to the Data Retrieval Plan approved by the SHPO in a letter dated 8/14/2019. It is the SHPO’s opinion that the project’s Adverse Effects to the J. Houck archaeological site have been mitigated.

If further correspondence is required regarding this project, please refer to the SHPO Project Review (PR) number noted above. If you have any questions, please contact me via email.

Sincerely,

Tim Lloyd, Ph.D.
Scientist - Archaeology

MANAGEMENT SUMMARY

SHPO Project Review Number: *Not yet assigned*
Involved State and Federal Agencies: *Not yet identified*
Phase of Survey: *IA/IB*

LOCATION INFORMATION

Municipality: *Town of Florida*
County: *Montgomery County*

SURVEY AREA

Length: *4,210 ft (m)*
Width: *1,890 ft (m)*
Acres: *120 acres*

RESULTS OF RESEARCH

Archeological sites within one mile: *12*
Surveys in or adjacent: *3*
NR/NRE sites in or adjacent: *0*
Precontact Sensitivity: *Moderate*
Historic Sensitivity: *Moderate to High*

ARCHEOLOGICAL SURVEY OVERVIEW

Number and Interval of Shovel Tests: *1,014 tests at 50-ft intervals*
Number and Size of Units: *n/a*
Width of Plowed Strips: *n/a*
Surface Survey Transect Interval: *n/a*

RESULTS OF ARCHEOLOGICAL SURVEY

Number and Name of Precontact Sites Identified: *None (0)*
Number and Name of Historic Sites Identified: *One (1), J. Houck Historic Site*
Number and Name of Sites Recommended for Phase II or Avoidance: *One (1), J. Houck Historic Site*

RECOMMENDATIONS

The J. Houck Historic Site was identified in the west-central portion of the APE, adjacent to the former alignment of NY Route 5S. The site consists of the remains of a foundation and well, and six shovel tests containing historic artifacts within an area measuring about 1 acre. Artifacts recovered in this vicinity suggest an occupation from c. 1830 through 1910. As avoidance is not feasible, Hartgen recommends that a Phase II archeological site evaluation be completed to determine if the site is National Register eligible.

Prior soil disturbance was noted in the westernmost section of the APE. With the exception of a stray historic artifact in Test 515, no other historic or precontact artifacts or features were noted in the APE. No further work is recommended in the remainder of the APE.

Report Authors: *Elizabeth Gregory, Matthew J. Kirk, R.P.A.*
Date of Report: *January 2018*

ABSTRACT

Hartgen Archeological Associates, Inc. (Hartgen) conducted a Phase I archeological investigation for the proposed Winstanley Distribution Center (Project) located in the Town of Florida, Montgomery County, New York. The total property acquisition includes approximately 140 acres. The proposed development will include the removal of existing structures and the construction of a 750,000 to 1,000,000 square-foot distribution center, parking, access roads, storm water management areas, and utility lines. No detailed site plans have yet been developed. The area of potential effects (APE) includes all portions of the property that will be directly altered by the proposed undertaking. The APE encompasses an estimated 120 acres of the total 140 acre Project.

The J. Houck Historic Site was identified in the west-central portion of the APE, adjacent to the former alignment of NY Route 5S. The site consists of the remains of a foundation and well, and six shovel tests containing historic artifacts within an area measuring about 1 acre. Artifacts recovered in this vicinity suggest an occupation from c. 1830 through 1910. As avoidance is not feasible, Hartgen recommends that a Phase II archeological site evaluation be completed to determine if the site is National Register eligible.

Prior soil disturbance was noted in the westernmost section of the APE, likely associated with the installation of the Lott Holding Corp. parking area. With the exception of a stray historic artifact in Test 515, no other historic or precontact artifacts or features were noted in the APE. No further work is recommended in the remainder of the APE.

Map 2. Project Map (Esri Inc. 2016)
Map 3. Soil Map (USDA NRCS 2006)
Map 4. (Geil and Hunter 1853; NYSDOT 1992; USGS 1895; USGS 1947)

Photograph List

Photo 1. View of the graveled drive at the westernmost boundary of the Project. Historic aerial photographs show extensive disturbance throughout the grassy area after 1995, highly visible between 2006 and 2013. View looking east.

Photo 2. Remnants of extensive disturbance are visible on the ground surface, and are also visible on Map 2. View looking northeast.

Photo 3. View looking west in the V-shaped wooded area. Piles of large rocks are visible throughout this wooded area, which was the original path of the present-day Route 5S.

Photo 4. View looking southwest towards the house and associated garage at 1733 Route 5S.

Photo 5. View looking northwest in the north-central portion of the Project. The house at 1733 Route 5S is visible in the background, and the distribution center across the street is visible to the right of the photo.

Photo 6. View looking northeast in the north-central portion of the Project. The farm stand and shed along Route 5S are visible to the left in the photo, and part of the garage and house at 1711 Route 5S are visible to the right in the photo.

Photo 7. Several completed shovel tests are visible in the snow, in the western-central portion of the Project. View looking northeast.

Photo 8. View looking east toward a steeply sloping area near the central portion of the APE.

Photo 9. The wooden farm stand and associated metal shed (visible behind the building) were located between the two extant houses on Route 5S. View looking southwest.

Photo 10. The house and associated garage at 1711 Route 5S. View looking southwest.

Photo 11. Four archeologists excavate shovel tests towards the central portion of the Project. View looking west.

Photo 12. Pink flags mark shovel tests at 50-ft intervals in the central-eastern portion of the Project. View looking northwest.

Photo 13. The area south of Tests 529 to 620 was steeply sloped. View looking southeast.

Photo 14. Archeologists excavate shovel tests towards the eastern-central portion of the Project. View looking southwest.

Photo 15. Some portions of the Project contained large areas of standing water. View looking west.

Photo 16. View looking southeast in the northeastern portion of the Project. This section of the APE consisted of brush and trees, occasionally dense.

Photo 17. Slope was noted between transects in the northeastern portion of the Project. View looking southeast.

Photo 18. Slope was noted between transects in the northern portion of the Project. View looking southeast.

Photo 19. Archeologists excavate shovel tests in a corn field in the eastern portion of the Project. View looking west.

Photo 20. View looking east towards the western boundary of the Project. The metal barn/storage building see on Map 2c is visible at the base of the slope.

Photo 21. The gravel drive leading to the large metal barn/storage building is visible off of Mead Road. The area to the left of the barn is steeply sloped. View looking northwest.

Photo 22. Shovel tests are flagged in the southernmost portion of the APE, south of the unnamed tributary of the South Chuctanunda Creek. View looking southeast.

Photo 23. Portions of this southern section of the APE, south of the South Chuctanunda Creek, were steeply sloped. View looking northwest from Test 551.

Photo 24. Three shovel tests were excavated in the wooded area towards the central-southern portion of the APE. View looking east.

Photo 25. Cattails and other plants typical of wet areas were visible towards the central portion of this southern section of the APE. Areas of standing water were not excavated. View looking east.

Photo 26. View looking northwest from Test 668. This southern section of the APE was brushy, with sections of standing water. A steeply sloping area is visible in the background of the photo.

Photo 27. A stone foundation, consistent with the location of MDS 1, was observed in the wooded area along the former path of present-day Route 5S. View looking north.

Photo 28. A stone well was observed adjacent to the foundation. View looking northeast.

PHASE I CULTURAL RESOURCES SURVEY

1 Introduction

Hartgen Archeological Associates, Inc. (Hartgen) conducted a Phase I archeological investigation for the proposed Winstanley Distribution Center (Project) located in the Town of Florida, Montgomery County, New York. This investigation was conducted to comply with Section 14.09 of the State Historic Preservation Act and will be reviewed by the New York State Office of Parks, Recreation and Historic Preservation (OPRHP). The investigation was conducted according to the New York Archaeological Council's *Standards for Cultural Resource Investigations and the Curation of Archaeological Collections* (1994), which are endorsed by OPRHP. This report has been prepared according to OPRHP's *State Historic Preservation Office (SHPO) Phase I Archaeological Report Format Requirements* (2005).

2 Project Information

2.1 Project Location

The Project is located between NY-5S, the New York State Thruway (I-90), and Mead Road, in the Town of Florida, Montgomery County, New York.

2.2 Description of the Project

The total property acquisition includes approximately 140 acres. The proposed development will include the removal of existing structures and the construction of a 750,000 to 1,000,000 square-foot distribution center, parking, access roads, storm water management areas, and utility lines. No detailed site plans have yet been developed, as the proposed owner is conducting due diligence prior to finalizing a footprint.

2.3 Description of the Area of Potential Effects (APE)

The area of potential effects (APE) includes all portions of the property that will be directly altered by the proposed undertaking. As no detailed site plans have yet been developed, the APE encompasses an estimated 120 acres of the total 140 acre Project.

3 Environmental Background

The environment of an area is significant for determining the sensitivity of the Project for archeological resources. Precontact and historic groups often favored level, well-drained areas near wetlands and waterways. Therefore, topography, proximity to wetlands, and soils are examined to determine if there are landforms in the Project that are more likely to contain archeological resources. In addition, bedrock formations may contain chert or other resources that may have been quarried by precontact groups. Soil conditions can provide a clue to past climatic conditions, as well as changes in local hydrology.

3.1 Present Land Use and Current Conditions

A site visit was conducted concurrent with fieldwork by Bradley Russell and Elizabeth Gregory on November 12, 2018 to observe and photograph existing conditions within the Project.

Presently, the land consists of two residential properties including houses, garages, and outbuildings (both properties to the north along Route 5S), a wooden farm stand building and associated small metal shed (central-north, along Route 5S), and a metal barn/shed structure to the east, off of Mead Rd. Several portions of the Project consist of brushy and wooded areas, and the remainder consists of actively farmed fields. The westernmost boundary lies along the edge of a graveled parking lot, part of which appears to extend into the Project. An unnamed tributary of the South Chuctanunda Creek runs along the southeastern boundary and through the southern portion of the Project. The Project is

bounded by NY-5S to the north, Mead Road to the southeast, a working farm and the New York State Thruway (I-90) to the south, and the property of Lott Holding Corp., 1785 NY Route 5, to the west.

There are two ponds within the Project, in addition to the unnamed tributary of the South Chuctanunda Creek. Areas of standing water were noted throughout the APE. Small streams ran through the wooded area in the northern section of the Project.

3.2 Soils

Soil surveys provide a general characterization of the types and depth of soils that are found in an area. This information is an important factor in determining the appropriate methodology if and when a field study is recommended (USDA NRCS 2018).

Table 1. Soils in Project

Symbol	Name	Depth	Textures	Slope	Drainage	Landform
AnB	Angola silt loam	0-23 cm (0-9 in) 23-61 cm (9-24 in) 61-71 cm (24-28 in)	Silty loam Silty clay loam Weathered bedrock	3-8%	Somewhat poorly drained	Benches, ridges, till plains

W	Water	--	--	--	--	--

3.3 Bedrock Geology

The bedrock within the Project consists of Canajoharie shale (Oc) of the Lorraine, Trenton, and Black River Groups. It is not known to be chert-bearing in Montgomery County.

3.4 Physiography and Hydrology

Steeply sloped areas are considered largely unsuitable for human occupation. As such, the standards for archeological fieldwork in New York State generally exclude areas with a slope in excess of 12% from archeological testing (NYAC 1994). Exceptions to this rule include steep areas with bedrock outcrops, overhangs, and large boulders that may have been used by precontact people as quarries or rock-shelters. Such areas may still warrant a systematic field examination.

After completing a slope analysis, it was determined that approximately 50 acres of the 120-acre APE contains slope in excess of 12%. The Project's topography is depicted on Map 2. The Project contains no areas of bedrock outcrops, overhangs, or large boulders. Based on this analysis, about 70 acres of the 120-acre APE will be tested.

Three waterways are located nearby or within the Project. The South Chuctanunda Creek is located 0.6 mi of the Project. An unnamed tributary of this creek runs along the southeastern boundary and through the southern portion of the APE. The APE contains two small ponds, one in the southern section and one towards the northwestern section. Finally, the Mohawk River is located approximately 4,300 feet northeast of the Project.

The two small ponds are both manmade. The pond associated with the property at 1733 Route 5S, located south of the house and garage, was created between 1995 and 2006 (Map 2a). The pond to the southeast, just north of the unnamed tributary and nearby I-90, appears to have been installed between 1969 and 1980 (Map 2e) (USGS 1969; USGS 1980).

4 Documentary Research

Hartgen conducted research using the New York State Cultural Resource Information System (CRIS), which is maintained by the New York SHPO and the Division for Historic Preservation DHP within OPRHP. CRIS contains a comprehensive inventory of archeological sites, State and National Register (NR) properties, properties determined eligible for the NR (NRE), and previous cultural resource surveys.

4.1 Archeological Sites

An examination of CRIS identified 12 reported archeological sites within one mile (1.6 km) of the Project (Table 2). Previously reported archeological sites provide an overview of both the types of sites that may be present in the Project and relation of sites throughout the surrounding region. The presence of few reported sites, however, may result from a lack of previous systematic survey and does not necessarily indicate a decreased archeological sensitivity within the Project.

Table 2. Archeological sites within one mile (1.6 km) of the Project

OPRHP Site No.	NYSM Site No.	Site Identifier	Description	Proximity to Project
05704.000092	1571	Terraut (AKA Terrant &, or Tenant) Site	Precontact site; no further information.	5,750 feet south
05704.000093	1572	Hartley Site	Precontact site; no further information.	5,940 feet south

OPRHP Site No.	NYSM Site No.	Site Identifier	Description	Proximity to Project
05704.000096	1579	Unnamed Site	Precontact site; no further information.	3,200 feet southeast
05704.000115	-	J. McClumpha Historic Archaeological Site	Pre-1853 historic site consisting of: a 1893 Chicago exposition medallion, whiteware, pearlware, flow blue, yellowware, spongeware, lusterware, gray salt-glazed stoneware, hand-painted polychrome pearlware, creamware, slip-decorated buff earthenware, hand-wrought nails, vessel- and window-glass, metal figurine fragments, and porcelain doll fragments.	2,350 feet northwest
05704.000116	-	W. McClumpha Historic Archaeological Site	Pre-1853 historic site consisting of: whiteware, semi-porcelain, pearlware, black-glazed redware, flow blue, yellowware, gray salt-glazed stoneware, hand-painted polychrome pearlware, creamware, vessel- and window-glass, as well as cut- and wire-nails.	1,910 feet north
05704.000120	11244	Farm Complex 1 (DeForest/Pettengill/Lohmeyer Farm)	Mid-19th Century historic farm complex that includes a collapsed barn, two silo foundations, a well, earthen ramps, a roadway, gate, chicken coop, and a milk house. A variety of early 20th Century farm equipment was also present.	500 feet northeast
05704.000121	11242	Farm Complex 2 (Fossgate/Houck Farm)	Mid-19th Century farm complex consisting of two houses (the Jacob and Christina Houck farmhouse and the J. Houck Tenant House), three barns, at least three small sheds, and the Houck family cemetery. The Jacob and Christina Houck farmhouse was dismantled (in hopes of future reconstruction elsewhere), two (of the three) barns, and three sheds were demolished in 2005.	320 feet north
05704.000122	11243	Farm Complex 3 (Keller/Walrath/Krochina Farm)	Early 19th Century farmhouse (initially used as a tavern), with tenant house added by the mid-19th Century. The complex also includes one extant barn (of unknown date) as well as the stone foundations of a possible carriage house (built over as a garage composed of mixed historic and modern building materials).	1,220 feet west
05704.000135	-	MCIDA P-1 Precontact Site	Precontact site consisting of one gray chert flake.	5,135 feet west
-	3317	ACP FUTN No#	Precontact traces of occupation, reported by Arthur C. Parker in 1922.	2,700 feet east
-	8355	ACP MTGY No#	Precontact trail, reported by Arthur C. Parker in 1922.	720 feet south
-	9258	ACP MTGY No#	Precontact traces of occupation, reported by Arthur C. Parker in 1922.	5,010 feet northwest

4.2 Historic Properties

An examination of CRIS did not identify any NR properties, NRE properties, properties previously determined to be ineligible, nor any properties of undetermined status within the Project.

4.3 Previous Surveys

A review of CRIS identified three previous surveys within the immediate vicinity of the Project (Table 3).

Table 3 Relevant previous surveys within or adjacent to the Project

Project/Phase	Summary	Citation
PIN 2029.57.101 (State Routes 5S & 30), Phase I	This Project was located along NY Route 5S. The precontact archeological sensitivity was considered moderate, and the historic archeological sensitivity was considered moderate to high. Three historic sites were identified during Phase IB investigations. No precontact artifacts or features were identified during this survey. Additionally, 48 structures were assessed, thirteen of which were determined to be National Register Eligible.	(Hartgen Archeological Associates 2002)
Proposed Florida Business Park (Lot 4), Phase IA/IB	The NRE structure (Fossgate/Houck Farmstead) and known historic features, including walkways and a stone wall, and a small family cemetery were located in the Project. A walkover survey, stripping, and excavation of 160 shovel tests were completed here. The Phase IB survey located a number of 19th century ceramics, brick and mortar fragments, faunal bones. Seven historic features, including a well-preserved stone walkway located near the farmhouse, were documented during this survey. Several areas contained extensive disturbance. No precontact artifacts or features were noted within the Project. Avoidance or further investigation was recommended for the areas of the Project containing the Fossgate/Houck house and associated features.	(Hartgen Archeological Associates 2003)
Beech-Nut Relocation Project, Phase IA/IB	The precontact and historic archeological sensitivities was determined to be moderate. A total of 276 tests were excavated at 50-ft intervals. No archeological deposits or features were found. No further work was recommended.	(Hartgen Archeological Associates 2008)

Historic maps indicate that development occurred throughout the region, beginning prior to 1850. Five early- to mid-19th c. archeological sites have been recorded within one mile of the current Project, two located within 500 feet (Farm Complex 2, Fossgate/Houck Farm (05704.000121) and Farm Complex 1, DeForest/Pettengill/Lohmeyer Farm (05704.000120)). Three other reported farm sites are located north of the Project. All of these farm houses are visible on the 1853 Geil Montgomery Co. map (Map 4) (Geil and Hunter 1853).

The current Project is bounded by New York State Highway 5S at the northern end. The 2002 State Routes 5S & 30 project determined that "no significant subsurface deposits other than features visible at the surface were recovered from the Farm Complex 1 area at SR 5S and Broadway Extension," located near the northeastern section of the current Project.

The Fossgate/Houck Farmstead was located at the intersection of Hirschfield Rd and NY State Highway 5S. Hirschfeld Road, which was once located near the intersection of Broadway and NY-5S, across the street from the current Project, was removed sometime after 2003. It was replaced by "Nutritious Pl." and the distribution center complex. The Beech-Nut Relocation Project was located just north of the current Project, on the opposite side of NY-Route 5S.

5 Historical Map Review

Historic maps indicate some historic development within the Project. Late 19th- to mid-20th century maps, dating between 1895 and 1947, depict a historic road through the APE (Old Route 5S), which appears to follow the current V-shaped tree line in the northern section of the Project. On late 19th to early 20th-century maps, two structures appear along this road (MDS 1 and 2) (Map 4). These two map-documented structures, labelled "J. Hawke," are visible on maps beginning in 1895 and were presumably constructed between 1853 and 1895. They appear to have been removed sometime between 1924 and 1931. The road appears to have been rerouted

to its current configuration between 1947 and 1949 (present-day NY-5S) and two houses were constructed on lots north of the former roadway, fronting the new portion of Route 5S. The Old Route 5S ran along the properties' southern boundaries, along or through what is currently a tree line.

Currently, two houses and associated structures are extant within the Project; the oldest was constructed c. 1989. Two houses, associated garages and sheds, and a barn and shed are located in the northwestern section of the Project, along NY-5S. A review of historic aerial images indicates that the barn and shed structures located on the lot between the two extant houses, as well as the associated horseshoe-shaped driveway, were constructed between 1995 and 2005.

A barn or storage structure is also located at the eastern edge of the Project, near Mead Road, and was built in the late 20th century, prior to 1995.

5.1 Map-Documented and Existing Structures

Each past or current structure within the Project is assigned a unique structure number. Map-documented structures—those structures that are depicted on one or more maps—are distinguished using the abbreviation "MDS" after the structure number (e.g. Structure 3 (MDS)).

Table 4. Summary of map-documented and existing structures within the Project /APE

Structure #	(Geil and Hunter 1853)	(Nichols 1868)	(USGS 1895)	(USGS 1931)	(USGS 1947)	(NYSDOT 1992)	Extant (2018)	Notes
1	"J. Hawke"	"J. Houck"	X					
2	"J. Hawke"							
3			X					
4						X	X	1733 Route 5S
5							X	1711 Route 5S
6							X	Farm stand (Rt 5S)
7							X	Barn (Mead Rd.)

MDS 1 and MDS 2 were both labelled "J. Hawke" on the 1853 Geil map. This was a misspelling on the early map, and was later corrected to "J. Houck" on the 1868 map. The members of the Houck family who occupied these two structures, within the current Project, were likely close relatives of the Houck family who occupied the mid-19th century Farm Complex 2 (Fossgate/Houck Farm) (05704.000121), located 320 feet north of the current Project.

There are nine (9) individual and associated structures within the Project (Maps 2a, 2b, and 2c). All extant structure within the APE are of recent construction dates. Construction dates were determined using historic map review and historic aerial photography.

- The house and associated garage at 1733 Route 5S (Photo 4) appear to have been constructed between 1980 and 1992. The pond and associated shelter to the south of the house were created between 1995 and 2006.

- The house, associated garage, and small shed at 1711 Route 5S (Photo 10) were constructed between 1992 and 1995.

- The farm stand and associated shed along Route 5S, between the two houses (MDS 4 and 5) were constructed between 2005 and 2006 (Photo 9).

- The extant metal barn/large shed off of Mead Road was constructed between 2001 and 2005 (Photos 20-21), and replaced an earlier barn immediately to its south that was constructed prior to 1995.

6 Archeological Sensitivity Assessment

The New York Archaeological Council provides the following description of archeological sensitivity:

> Archaeologically sensitive areas contain one or more variables that make them likely locations for evidence of past human activities. Sensitive areas can include places near known prehistoric sites that share the same valley or that occupy a similar landform (e.g., terrace above a river), areas where historic maps or photographs show that a building once stood but is now gone as well as the areas within the former yards around such structures, an environmental setting similar to settings that tend to contain cultural resources, and locations where Native Americans and published sources note sacred places, such as cemeteries or spots of spiritual importance (NYAC 1994:9).

6.1 Precontact Archeological Sensitivity

The precontact sensitivity of an area is based on proximity to previously documented precontact archeological sites, known precontact resources (e.g. chert outcrops), and physiographic characteristics such as topography and drainage. Generally, areas in the vicinity of streams and wetlands are considered to have elevated sensitivity for sites associated with Native American use or occupation because they presented potential food and water sources as well as transportation corridors.

Seven precontact archeological sites have been reported within one mile of the current Project, although most are located 2,700 to 5,940 feet away. Additionally, the bedrock within the Project is not known to be chert bearing in Montgomery County. However, three water sources are located within or nearby the current Project. Given this information, the precontact archeological sensitivity for the Project is moderate.

6.2 Historic Archeological Sensitivity

The historic sensitivity of an area is based primarily on proximity to previously documented historic archeological sites, map-documented structures, or other documented historical activities (e.g. battlefields).

Historic maps indicate that development occurred throughout the region, beginning prior to 1850. Five early- to mid-19th c. historic archeological sites have been recorded within one mile of the current Project, with two located within 500 feet (Farm Complex 2, Fossgate/Houck Farm (05704.000121) and Farm Complex 1, DeForest/Pettengill/Lohmeyer Farm (05704.000120)). Three other reported farm sites are located north of the Project. All of the residential structures identified within these sites are visible on the 1853 Geil Montgomery Co. map (Geil and Hunter 1853). Additionally, historic maps indicate that the Old Route 5S ran through the current Project, and that two mid- to late 19th-century structures appear to have been located along the old Route 5S within the Project. The historic archeological sensitivity is high.

7 Archeological Potential

Archeological potential is the likelihood of locating intact archeological remains within an area. The consideration of archeological potential takes into account subsequent uses of an area and the impact those uses would likely have on archeological remains.

Approximately 50 acres of the 120-acre total APE are sloped in excess of 12%. The archeological potential in these areas is low, and no testing is recommended here.

It appears that limited development has occurred within the remaining 70 acres. Historic maps indicate the route of Old Route 5S ran along the current tree line in the west/northwestern portion of the Project, and that two structures were located along this roadway. After these structures were removed between 1853 and 1868 (MDS 2) and between 1924 and 1931 (MDS 1), it does not appear that any further development occurred in that vicinity and the roadway was rerouted to its present configuration between 1947 and 1949. It appears that the only other development within this Project was the construction of the extant houses, associated garages, and sheds along the current Route 5S, all built after 1989, and the farm stand and shed between the houses, constructed between 1995 and 2005. The metal barn structure in the southeastern section of the APE, off of Mead Road, was constructed in the late 20th century. Aerial photographs appear to show some disturbance

between 2006 and 2013 in the western portion of the Project, east of the Lott company property and south of the tree line. This may indicate a reduced archeological potential in this area.

Five nearby early to mid-19th century farmstead sites were identified and reported during previous surveys of the adjacent properties north and west of the current Project. Some disturbance was noted during these surveys but the sites appeared mostly intact. The overall archeological potential for the Project is moderate to high.

8 Archeological Survey

After completing a slope analysis, it was determined that approximately 50 acres of the 120-acre APE contain slope in excess of 12%, which has a low archeological potential. Based on this analysis, about 70 acres of the 120-acre APE were tested. The remaining 70 acres had a moderate to high archeological potential, as well as a moderate precontact archeological sensitivity and a high historic archeological sensitivity. Shovel tests were laid out and excavated at 15 meter (50 ft) intervals in a grid pattern to achieve complete coverage of all remaining 70 acres.

8.1 Methodology

8.1.1 Shovel Testing

Shovel tests were excavated at a standard interval of 15 meters (50 ft). Each shovel test was 40 centimeters (16 in) in diameter. All excavated soil was passed through 0.25-inch hardware mesh and examined for both precontact (Native American) and historic artifacts. The stratigraphy of each test was recorded including the depth, Munsell color, soil description, and artifact content (Munsell Color 2000). The location of each shovel test was plotted on the project map. Test excavation was photographed.

8.1.2 Artifacts and Laboratory

As general procedure, all precontact (Native American) cultural material identified during the fieldwork are collected. Significant historic artifacts such as glass, ceramics, food remains, hardware, and miscellaneous items are collected. Coal, ash, cinder, brick, and modern materials are noted. Any artifacts collected are placed in paper or plastic bags labeled by provenience and inventoried in a bag list. Bags are numbered in the field and transported to the Hartgen laboratory in the Town of North Greenbush, Rensselaer County, New York, for processing.

Shovel test records and other provenience information were entered into a Microsoft *Access* database (Appendix 1). Artifacts were cleaned and cataloged. Cataloging entailed entering artifact provenience information, counts, weights, and descriptive information into the database (Appendix 2).

8.2 Results

The Phase IB archeological field reconnaissance was conducted between November 12 and November 29, 2018. The field crew consisted of Jamie Penk, Tom Boyd, Cindy Jackson, Adam Gersten, Joe Rynasko, Drew David, Amy Wilson, and John Ham. Bradley Russell and Elizabeth Gregory served as Field Supervisors. Matthew J. Kirk was the Principal Investigator. The weather was variable, ranging from moderately chilly and clear to cold and rainy to snow. Excavations were not completed in severe weather, and so the weather did not affect visibility of soil stratigraphy or artifact recovery. Soils throughout the Project were poorly drained (Table 1), and many shovel tests contained water at the base. Some tests were located within wet areas, including some areas with deep standing water and, as such, were not excavated. A total of 1048 shovel tests were laid out at 50-ft intervals throughout the APE; a total of 1014 shovel tests were excavated (Appendix 1).

Map 2a

The westernmost portion of the Project, adjacent to the property of Lott Holding Corp., was largely disturbed (Map 2a). This correlated with the suspected disturbance seen on aerial photographs dating between 2006 and 2013. Soils were highly variable with a great deal of mottling. Level 1 soils ranged from a dark grey to a very

dark grayish brown to a very dark brown and were typically silty loam or silty sand. Level 2 was often inaccessible due to gravel and rocks, but when visible appeared as a yellowish brown silt, or a dark brown to dark grayish brown silty or loamy clay. In one area, Tests 451, 452, 488, 489, 491, and 493 contained large amounts of wood mulch, with Test 488 containing 50 cm consisting entirely of black mulch. Other tests in this area noted concrete inclusions, gravel, metal, plastic, and wood debris, primarily where dumping has occurred within and just south of the woods line. Concrete and steel pillars, visible on the orthoimage (Map 2a), were located near Test 160. Test 351 was located adjacent to a pile of building and construction rubble, including concrete parking barriers and aluminum siding. Black plastic geotextile fabric was noted in a few separate areas within the western section, generally accompanied by mottled soils in Level 1, and rocky soils or compact fill beneath the fabric.

The most typical soil profile in the intact areas of the westernmost portion of the Project was a dark grayish brown to very dark gray silty loam A Horizon to a depth of about 22-24 cm, underlain by a brown, olive brown, or yellowish brown silty loam or silty clay B Horizon.

Within the wood line was evidence of an old rock wall, with piles of cobbles visible in a line throughout this area. Two small streams, roughly parallel to one another, also ran through the wooded area alongside the rock wall. Some disturbance was noted throughout this area, though initially little evidence of the former roadway was visible on the surface. Upon closer examination, it appears that the two small parallel streams were drainage ditches on either side of the former roadway. The brush was quite dense in some spots in this wooded section.

The typical soil profile within the residential properties along Route 5S consisted of a very dark grayish brown silty loam A Horizon to a depth of around 30 cm, underlain by a dark grayish brown or yellowish brown silty loam or silty clay B Horizon (Map 2a). A gas utility pipe was located 3m north of Test 41, next to the driveway at 1733 Route 5S. Disturbance, including made land (a pathway wrapping around the southern portion of the man-made pond) was noted south of the house.

The wooded area came to a point south of the farm stand. Here, shovel tests 354, 360, 400, and 429-431 were positive for historic cultural materials. These positive tests were located nearby a stone foundation and a stone well. The artifacts collected in this vicinity included a strap hinge, likely a barn door hinge dating to the mid-late 19th century, and two pieces of unidentified wire hardware surface collected near the foundation remains. In addition to the surface artifacts, nearby shovel tests contained cut nails, handmade amber bottle glass, manganese solarized and embossed pale aqua vessel glass, faunal bone, and a variety of ceramics including redware, whiteware, salt-glazed Albany slip stoneware, and molded ironstone. The metal strap hinge, cut nails, salt-glazed Albany slip stoneware, molded ironstone, and handmade amber bottle glass can be approximately dated to the mid- to late-19th century, a time period consistent with the occupation of the house according to historic maps.

The parallel streams, rock wall, and former roadway continue through the area adjacent to the foundation and continue northeast, following the path of the former roadway as illustrated on historic maps. Here, the former roadway became evident upon closer examination of the small streams and strip of land between them.

Map 2b

Map 2b depicts the farm stand, its associated shed, and the house at 1711 Route 5S along with its associated outbuildings. The current owner of the property at 1711 Route 5S indicated the general location of a septic field to the field crew, evident in Tests 255, 256, 258, 259. Other tests in this vicinity also contained mottled soils. In the field south of 1711 Route 5S, the typical soil profile was approximately 35 cm of dark or very dark grayish brown silty loam, underlain by a brown to yellowish brown silty clay subsoil.

The field south of the wood line, towards the central and eastern portions of the Project, appeared to be intact according to historic aerials (Map 2b). In the area near Tests 504-529 and 579-620, the typical soil profile was a dark gray to dark grayish brown silty loam, to a depth of about 25-30 cm, underlain by a light olive brown to dark yellowish brown B Horizon. Exfoliating bedrock was noted along the ridge to the south of this section, and towards the ridge tests contained gravel and cobbles. All tests in this section were negative, with the exception of Test 515 which contained a stray historic artifact, a porcelain cup base.

Map 2c

The typical soil profile in this area (Tests 669-1009) appears as a brown to dark grayish brown silty loam or clay loam A Horizon to a depth of 30-35 cm, underlain by a brown to yellowish brown silty clay subsoil. A number of tests contained gravel and cobbles, and tests towards the ridge line often contained exfoliating bedrock. Along the ridge line in the eastern portion of the Project, bedrock was shallow and several tests were terminated at depths between 28- 40 cm due to bedrock. No artifacts or features were noted in this area.

The westernmost section of the APE (Tests 1040-1047) near the extant metal barn structure appeared somewhat disturbed around the structure, likely due to the clearing of the original barn, the pouring of the concrete pad foundation, and construction of the structure and associated driveway. Here the first level was a very dark grayish brown silty loam, with some gravel and cobbles present. Subsoil was not reached in any test due to an influx of water, or rock and compact soil impasses.

Map 2d

Map 2d depicts the southwestern section of the APE (Tests 533-578), located south of the unnamed tributary and north of I-90. The westernmost portion of this segment consisted of built land (Table 1; Map 3) and was not excavated. Portions of this section were avoided due to slope in excess of 12%.

The typical soil profile in this section was a 23-33 cm brown to dark grayish brown silty loam or silty clay Ap Horizon, underlain by a brown to dark yellowish brown silty clay or clay subsoil. No historic or precontact artifacts or features were noted in this section.

Map 2e

Map 2e depicts the south-central portion of the APE (Tests 621-668). The central part of this section was wet with areas of standing water, and contained cattails and other plants found in wet areas. The typical soil profile in this area was 33-45 cm dark to very dark grayish brown silty loam A Horizon, underlain by a brown to dark yellowish brown silty clay or loamy clay subsoil. Subsoil was not reached in the majority of tests in this low-lying area, due to rock impasses, or water infiltration from the wet area and the poor drainage of the soils here. No precontact or historic artifacts or features were noted in this area.

Summary

One archeological site consisting of a stone foundation, a stone well, and mixed historic artifacts, was identified during this survey. The locations of the foundation and well were mapped with GPS equipment, and the foundation appears to correlate with the structure labelled J. Hawke on the 1853 Geil map that was located within the APE of the current Project (MDS 1).

8.2.1 J. Houck Historic Site

Table 5. Summary of Archeological Site 1

Characteristic	**Site information**
Site Name	J. Houck Historic Site
Description	Historic site consisting of a stone foundation and well. Artifacts included a barn door hinge, two pieces of unidentified wire hardware, cut nails, handmade amber bottle glass, manganese solarized and embossed pale aqua vessel glass, faunal bone, and a variety of ceramics including redware, whiteware, salt-glazed Albany slip stoneware, and molded ironstone. The metal strap hinge, cut nails, salt-glazed Albany slip stoneware, molded ironstone, and handmade amber bottle glass can be approximately dated to the mid- to late-19th century, a time period consistent with the occupation of the house according to historic maps.
Date	c. 1830 to 1910
Function	Domestic site
Size	Approximately 1 acre

The foundation and well are associated with MDS 1, which first appears on the 1853 Geil Montgomery Co. map. On this map, both MDS 1 and MDS 2, located northeast of MDS 1, are connected by a dotted line and are labelled "J. Hawke," a misspelling of the family's name. The 1868 Nichols map corrects the name's spelling, labelling MDS 1 "J Houck" and a nearby residence (possibly still MDS 2) "J.H." The J. Houck Historic Site identified during the current survey appears to be associated with the previously identified Farm Complex 2 (Fossgate/Houck Farm) site (OPRHP 05704.000121/ NYSM 11242), located 320 feet north of the Project; it is likely that the residents of the Map-Documented Structures within the current Project (MDS 1 and MDS 2) were close relatives of the Houck family residing on the Fossgate/Houck Farm (05704.000121).

9 Recommendations

The J. Houck Historic Site was identified in the west-central portion of the APE, adjacent to the former alignment of NY Route 5S. The site consists of the remains of a foundation and well, and six shovel tests containing historic artifacts within an area measuring about 1 acre. Artifacts recovered in this vicinity suggest an occupation from c. 1830 through 1910. As avoidance is not feasible, Hartgen recommends that a Phase II archeological site evaluation be completed to determine if the site is National Register eligible.

Prior soil disturbance was noted in the westernmost section of the APE, likely associated with the installation of the Lott Holding Corp. parking area. With the exception of a stray historic artifact in Test 515, no other historic or precontact artifacts or features were noted in the APE. No further work is recommended in the remainder of the APE.

Photographs

Photo 1. View of the graveled drive at the westernmost boundary of the Project. Historic aerial photographs show extensive disturbance throughout the grassy area after 1995, highly visible between 2006 and 2013. View looking east.

Photo 2. Remnants of extensive disturbance are visible on the ground surface, and are also visible on Map 2. View looking northeast.

Photo 3. View looking west in the V-shaped wooded area. Piles of large rocks are visible throughout this wooded area, which was the original path of the present-day Route 5S.

Photo 4. View looking southwest towards the house and associated garage at 1733 Route 5S.

Photo 5. View looking northwest in the north-central portion of the Project. The house at 1733 Route 5S is visible in the background, and the distribution center across the street is visible to the right of the photo.

Photo 6. View looking northeast in the north-central portion of the Project. The farm stand and shed along Route 5S are visible to the left in the photo, and part of the garage and house at 1711 Route 5S are visible to the right in the photo.

Photo 7. Several completed shovel tests are visible in the snow, in the western-central portion of the Project. View looking northeast.

Photo 8. View looking east toward a steeply sloping area near the central portion of the APE.

Photo 9. The wooden farm stand and associated metal shed (visible behind the building) were located between the two extant houses on Route 5S. View looking southwest.

Photo 10. The house and associated garage at 1711 Route 5S. View looking southwest.

Photo 11. Four archeologists excavate shovel tests towards the central portion of the Project. View looking west.

Photo 12. Pink flags mark shovel tests at 50-ft intervals in the central-eastern portion of the Project. View looking northwest.

Photo 13. The area south of Tests 529 to 620 was steeply sloped. View looking southeast.

Photo 14. Archeologists excavate shovel tests towards the eastern-central portion of the Project. View looking southwest.

Photo 15. Some portions of the Project contained large areas of standing water. View looking west.

Photo 16. View looking southeast in the northeastern portion of the Project. This section of the APE consisted of brush and trees, occasionally dense.

Photo 17. Slope was noted between transects in the northeastern portion of the Project. View looking southeast.

Photo 18. Slope was noted between transects in the northern portion of the Project. View looking southeast.

Photo 19. Archeologists excavate shovel tests in a corn field in the eastern portion of the Project. View looking west.

Photo 20. View looking east towards the western boundary of the Project. The metal barn/storage building see on Map 2c is visible at the base of the slope.

Photo 21. The gravel drive leading to the large metal barn/storage building is visible off of Mead Road. The area to the left of the barn is steeply sloped. View looking northwest.

Photo 22. Shovel tests are flagged in the southernmost portion of the APE, south of the unnamed tributary of the South Chuctanunda Creek. View looking southeast.

Photo 23. Portions of this southern section of the APE, south of the South Chuctanunda Creek, were steeply sloped. View looking northwest from Test 551.

Photo 24. Three shovel tests were excavated in the wooded area towards the central-southern portion of the APE. View looking east.

Photo 25. Cattails and other plants typical of wet areas were visible towards the central portion of this southern section of the APE. Areas of standing water were not excavated. View looking east.

Photo 26. View looking northwest from Test 668. This southern section of the APE was brushy, with sections of standing water. A steeply sloping area is visible in the background of the photo.

Photo 27. A stone foundation, consistent with the location of MDS 1, was observed in the wooded area along the former path of present-day Route 5S. View looking north.

Photo 28. A stone well was observed adjacent to the foundation. View looking northeast.

MANAGEMENT SUMMARY

SHPO Project Review Number: *Not yet assigned*
Involved State and Federal Agencies: *Not yet assigned*
Phase of Survey: *Phase II Site Evaluation*

LOCATION INFORMATION

Municipality: *Town of Florida*
County: *Montgomery County*

SURVEY AREA

Length: *207 feet (63 meters)*
Width: *195 feet (60 meters)*
Acres: *0.85 acres*

RESULTS OF ARCHEOLOGICAL SITE EVALUATION

Site Name and Site Number: *J. Houck Historic Site*
Cultural Affiliation: *Historic*
Site Size: *3,437 m^2 (37,000 ft^2)*
Number of Shovel Tests: *64*
Number of Units Excavated: *9*
Total Area Excavated: *8.5 m^2*
Number of Sites Recommended Eligible for National Register: *One (1)*

RECOMMENDATIONS

The J. Houck Historic Site contains significant archaeological data in undisturbed contexts. The property was owned by the locally important Houck family over several generations who used the site as a rental property. It was occupied by a series of tenants, many of whom worked as laborers for the Houck family. If the site cannot be avoided, phase III data recovery is recommended. In particular, additional units should be placed near the structure to more completely understand the form and construction history of the building and acquire a more robust sample of contemporary artifacts from good contexts. Those goals would also be served by digging a sump to lower the level of local ground water and allow excavation within the basement hole. The well should be bisected with a backhoe trench to determine if useful data can be acquired from below the layer of field cobbles currently preventing sampling. An area of approximately 20 meters around the house and well should be mechanically stripped of soil in order to identify features such as middens or privies. If encountered, these features should be studied and sampled.

Date of Report: *March 2019*

ABSTRACT

Hartgen Archeological Associates, Inc. (Hartgen) conducted a Phase II archeological site evaluation of the J. Houck Historic Site, which is located within the Area of Potential Effects (APE) for the proposed Winstanley Distribution Center project in the Town of Florida, Montgomery County, New York. The J. Hawke/J. Houck site was identified during Hartgen's earlier Phase I Archeological Investigation (Hartgen Archeological Associates 2019). The name J. Houck is also associated with another property farther east on Route 5S which was previously investigated by Hartgen before the main residential structure was dismantled (Hartgen Archeological Associates 2008a, b). The house is known to have belonged to Jacob and Christina Houck. Several generations of Houck's occupied the main house originally owned by Jacob and Christina. They also owned an adjacent tenant house that they rented to a series of individuals. The residence at the J. Houck site under study here, also appears to have been a rental property. The objective of this study was to delineate the boundaries of the J. Hawke/J. Houck Historic Site and evaluate if it meets the criteria for inclusion on the National Register of Historic Places.

Shovel tests indicated that the site stratigraphy was reasonable uniform with an A horizon consisting of a dark grey silt loam with an approximate depth of between 20 and 55 cm. The B horizon was a yellowish or greyish brown clay silt mix. The soils were rather poorly drained owing to the clay in the B horizon. Units 2, 4 and 6 contained a man-made layer of floor slabs/cobbles that were likely placed on the existing surface at the time of construction which have since accumulated enough soil to be buried just below the present day surface.

Our initial indication of the date of the structure came from a sample of the collapsed bricks located along the west side of the structure whose attributes suggested a manufacturing date of ~1820 (between 1810 and 1830). However, the best archaeological indications of the chronology for the features come from two artifacts with clear dates. Three refitted ironstone ceramic sherds featuring an embossed lily of the valley motif dating from the 1850's or 60's was recovered in Level 3 of Unit 3 alongside the west foundation wall in a context that suggests it was deposited in the construction trench when the foundation was built. We know from the Geil map that the main structure was present by 1853, suggesting this would be an early example of the style. Feature 2, the floor in the structure's addition is securely dated as having been constructed sometime after 1888, the date on an Indian head penny located immediately below a large floor slab in unit 2, just south of the foundation wall. We know that the structure was still present at the time that the 1905 century map was published and that it was demolished before the creation of the 1920's midden deposit in the cellar hole. Possibly not coincidentally, its owner Jacob Houck died in 1905.

The artifacts collected during our investigation are consistent with an occupation lasting from the early to mid-19th century until the early 20th. There are two distinct midden deposits on the site, one from the 1920's and the other from the 1930's that postdate the occupation phase. There is no indication of disturbance of the site, suggesting that the site retains its integrity and has the potential to provide useful data. The artifact distribution is quite restricted with almost all recovered materials from both Phases I and II being restricted to a 33 meter (110 feet) radius around the structure foundations. The collection is a typical domestic assemblage including ceramics, glass and food remains.

The significance of the J. Houck Historic Site is assessed according to the National Park Service's *Guidelines for Registering and Evaluating Archeological Properties* (Little, et al. 2000). The site meets eligibility Criteria B "are associated with the lives of persons significant in our past" and D for the National Register and has "yielded, or may be likely to yield, information important in prehistory or history."

PHASE II ARCHEOLOGICAL SITE EVALUATION

1 Introduction

Hartgen Archeological Associates, Inc. (Hartgen) conducted a Phase II archeological site evaluation of the J. Houck Historic Site, which is located within the Area of Potential Effects (APE) for the proposed Winstanley Distribution Center project in the Town of Florida, Montgomery County, New York.

This investigation was conducted to comply with Section 14.09 of the State Historic Preservation Act and will be reviewed by the New York State Office of Parks, Recreation and Historic Preservation (OPRHP). The investigation was conducted according to the New York Archaeological Council's *Standards for Cultural Resource Investigations and the Curation of Archaeological Collections* (1994), which are endorsed by OPRHP. This report has been prepared according to OPRHP's *State Historic Preservation Office (SHPO) Phase I Archaeological Report Format Requirements* (2005).

The J. Hawke/J. Houck site (Maps 1 and 2) was identified during Hartgen's earlier Phase I Archeological Investigation (Hartgen Archeological Associates 2019). During the Phase IB shovel testing, a total of 1014 tests were excavated. Seven of those tests were positive for historic artifacts. Six of the positives were located in close proximity to a cut stone foundation (Photos 1-3) and well (Photos 4 and 5) also recorded during the study (Figure 1). The location matched the position of the J. Houck property first identified during the Phase IA study. This property was originally shown on maps in 1856 and 1866 (Geil and Hunter 1853; Nichols 1868). Earlier maps do not list individual properties. The site is likely older than 1853. It was depicted on maps through the 1905 Century map after which it disappears (Century Map Company 1905). The name J. Houck is also associated with another property (Figure 5) farther east on Route 5S which was previously investigated by Hartgen before the main residential structure was dismantled (Hartgen Archeological Associates 2008a, b). The house is known to have belonged to Jacob and Christina Houck. Several generations of Houck's occupied the main house originally owned by Jacob and Christina. They also owned an adjacent tenant house that they rented to a series of individuals. The residence at the J. Houck site under study here, also appears to have been a rental property.

The objective of this study was to delineate the boundaries of the J. Hawke/J. Houck Historic Site and evaluate if it meets the criteria for inclusion on the National Register of Historic Places.

Note: As we know that the correct spelling of the owner's name is Houck, we will be dropping the Hawke designation which reflects a misspelling on one historic map.

2 Background

The following summarizes the available site information prior to the Phase II site evaluation.

Table 1. Summary of archeological site information collected during the Phase I survey

Characteristic	Site information
OPRHP Site No.	Not yet assigned
Site Name	J. Houck Historic Site
Description	Historic site consisting of a stone foundation and well. Artifacts included: The artifacts collected in this vicinity included a strap hinge, likely a barn door hinge dating to the mid-late 19th century, and two pieces of unidentified wire hardware surface collected near the foundation remains. In addition to the surface artifacts, nearby shovel tests contained cut nails, handmade amber bottle glass, manganese solarized and embossed pale aqua vessel glass, faunal bone, and a variety of ceramics including redware, whiteware, salt-glazed Albany slip stoneware, and molded ironstone. The metal strap hinge, cut nails, salt-glazed Albany slip stoneware, molded ironstone, and handmade amber bottle glass can be approximately dated to the mid- to late-19th century, a time period consistent with the occupation of the house according to historic maps.

Characteristic	Site information
Date	~1830-1910
Function	Residential
Size	~0.85 acres
Location	NAD 83, UTM Zone 18, 562724 Easting, 4753742 Northing

2.1 Environmental Setting

The site is located in a wooded section of the APE. Historic aerial photos from the 1950's show the entire area around the site cleared of trees. A small plot surrounding the foundations remained wooded. The effect of this can be seen in the tree line today. The trees surrounding the features are notably larger and older than those in adjacent areas. The brush is quite dense in some spots in this wooded section.

Within the wood line there is evidence of an old rock wall (Photos 6 and 7), with piles of cobbles visible in a line throughout this area. Two small streams, roughly parallel to one another, also run through the wooded area alongside the rock wall. Historic maps of the area show the Houck property located just to the north of a roadway that has since been rerouted. The former roadway became evident upon closer examination of the small streams and strip of land between them. It appears that the two small parallel streams were drainage ditches on either side of the former roadway (Photo 7-9). The parallel streams, rock wall, and former roadway continue through the area adjacent to the foundation and continue northeast, following the path of the former roadway as illustrated on historic maps.

The soils in the area are quite poorly drained, with standing water in many locations and water common in test pits and units. The most typical soil profile is a dark grayish brown to very dark gray silty loam A Horizon to a depth of about 22-24 cm, underlain by a brown, olive brown, or yellowish brown silty loam or silty clay B Horizon. It is not clear if the depth of the water table has changed over time. However, it is likely that it was lower at the time that the basement foundation was constructed. Unit 1 in the southwest corner of the foundation reached water quite rapidly, apparently before we reached the floor level. That suggests that either the water table was lower in the past or that the basement would have experienced regular flooding issues.

There are two significant midden deposits associated with the foundations. Both appear to have been created post-abandonment of the structure. Within the foundations, there is a dense deposit of materials dating to the 1920's. Some of that material is at the surface (Photo 2). But, much of it is buried below rounded cobbles, which seem to have been cleared from nearby agricultural fields and discarded in the basement hole sometime after the 1920's. The bulk of these cobbles are in the southeast and southwest corners of the feature. Additional cobbles have been disposed of inside the well. The second midden is located on the surface to the southwest of the foundation (Photo 10). This deposit contains artifacts dating to the 1930's.

2.2 Geomorphological Context

The site sits on a ridge top at the highest point in the APE, with an altitude of 540 feet above sea level (Map 1). South of the site, the terrain slopes down to 450 feet along a creek flowing east into South Chuctanunda Creek. East of the site, the terrain also slopes down to 450 feet. Beyond the Project Area on the west and north, the terrain is relatively level with a small downward slope. There is a small rise back up to 570 feet not far to the north. The pond associated with the property at 1733 Route 5S which is located to the northeast of the site is manmade. Historic aerial photos indicate that it was constructed sometime between 1995 and 2005.

2.3 Historical/Cultural Context

Historic maps indicate that development occurred throughout the region, beginning prior to 1850 (Maps 3a and 3b). Five early- to mid-19th c. archeological sites have been recorded within one mile of the current Project, two located within 500 feet (Farm Complex 2, Fossgate/Houck Farm (The Jacob and Christina Houck House) (05704.000121) and Farm Complex 1, DeForest/Pettengill/Lohmeyer Farm (05704.000120)). Three other reported farm sites are located north of the Project. All of these farm houses are visible on the 1853 Geil Montgomery Co. map (Geil and Hunter 1853). The property under study was owned by Charles Williams in

the years immediately following the Revolutionary War (Dewitt 1790, 1802) and was referred to as "Warrensborough" (Sauthier 1779).

The National Register Eligible (NRE) Jacob and Christina Houck House (Hartgen Archeological Associates 2008a, b) was located at the intersection of Hirschfield Rd and NY State Highway 5S. The earlier Fossgate designation has been dropped as later research has revealed that the association was an error. Hirschfeld Road, which was once located near the intersection of Broadway and NY Rt. 5S, across the street from the current Project, was removed sometime after 2003. It was replaced by "Nutritious Pl." and the distribution center complex. The Beech-Nut Relocation Project was located just north of the current Project, on the opposite side of NY-Route 5S.

Maps indicate additional historic developments in the Phase I Project Area. Late 19th- to mid-20th century maps, dating between 1895 and 1947, depict a historic road through the APE (Old Route 5S), which appears to follow the current V-shaped tree line containing the features under investigation. On late 19th to early 20th-century maps, two map-documented structures appear along this road (MDS 1 and 2). They were incorrectly labeled "J. Hawke". Both are first visible on the 1853 map by Geil (Geil and Hunter 1853). It appears that MDS 1, which is located at the southern point of the angle in the highway, is the structure currently being investigated. Surface survey has not located any structure in the location of MDS 2 as shown on the Geil map, nor have shovel tests produced remains in the vicinity. It is probable that the structure shown actually represents the Jacob and Christina Houck house, which is located farther east along the same roadway and is missing from its correct location on the map despite being a very prominent and well known structure (See Figure 5). MDS 1 is depicted on maps through 1924 (Century Map Company 1905; Nichols 1868), after which it is absent. It is likely that the house had been demolished prior to 1924, as a series of topo maps from 1895 to 1924 look virtually identical and were apparently not updated. The next available 1931 map (the first to not depict the structure) shows a number of major differences and clearly represents new, updated mapping. However, it appears that the structure was definitely still present as of 1905 (Century Map Company 1905). MDS 2, The Jacob and Christina Houck house, continues to be shown our most recent maps (New York State Department of Transportation (NYSDOT) 1992). It was carefully dismantled in 2008 with plans to re-erect it in another location (Hartgen Archeological Associates 2008a, b). Topo maps indicate that ROUTE 5S was rerouted to its current configuration by 1947 (present-day NYS Bicycle Route 5) (United States Geological Survey (USGS) 1947)and two houses were constructed on lots north of the former roadway. The Old Route 5S ran along the properties' southern boundaries, along or through what is currently a tree line.

Research on the Houck properties is somewhat complicated by the repeated use of certain family names generation after generation. The first Jacob Houck was born between 1770 and 1780 as was his wife Christina. Jacob had a brother by the name of Peter. Jacob and Christina had four children, Isaac, Jacob, Catherine and Christina. Isaac, who was born in 1803, went on to marry a woman who was also called Christina. He inherited his father's house and remained there until his death in 1850. The couple had two sons, Jacob and Peter. Jacob, who was born in 1833, went on to inherit the house and remained there until his death in 1905. This is the "J. Hawke/J. Houck" whose name is associated with the property in the available historic maps. He and his wife Adeline had no children of their own. But, they adopted Jennie Miller (later Houck), his brother Peter's daughter. A forth Jacob, Jacob TenEyck, also shows up in various records. He appears to be the son of Christina, widowed daughter of the original Jacob and Isaac's sister.

Table 2. Summarized Houck family genealogy

Generation	First name	Last Name	Birth date	Death Date	Relationship	Children	Residence
1	Jacob (1)	Houck	1770-1780	1839	Husband to Christina (married 1799)	Isaac, Jacob (2), Catherine (1) and Christine (2)	Jacob and Christina House
1	Christina (1)	Entis	1770-1780	1849	Wife of Jacob (1) (married 1799)	Isaac, Jacob (2) 2 daughters	Jacob and Christina House
1	Peter (1)	Houck			Brother of Jacob	?	

2	Isaac	Houck	1803	1850	Son of Jacob (1) and Christina	Jacob, Peter, Maria (?)	Jacob and Christina House (owner as of 1840)
2	Catherine (Katie)		1810-1813	1890	Wife of Isaac	Jacob, Peter, Maria (?)	
2	Jacob (2)	Houck			Son of Jacob (1) and Christina	?	
2	Catherine (1)				Daughters of Jacob (1)		
2	Christina (2)				Daughters of Jacob (1)		
3	Jacob (3)	Houck	1833	1905	Son of Isaac and Catherine/Grandson of Jacob (1)	Adopted Jennie Miller	Jacob and Christina House (owner from 1850-1905)
3	Adeline	Van Horn	1833	1903	Wife of Jacob (3)	Adopted Jennie Miller	
3	Peter (2)	Houck	1839		Son of Isaac and Catherine/Grandson of Jacob (1)	Jennie (Jane) Miller	
3	Jacob	TenEyck			Son of Catherine (1) (?)/Grandson of Jacob (1)		
3	Catherine (2)	TenEyck (?)			Daughter of Catherine		
3	Christina (3)	TenEyck (?)			Daughter of Catherine		
3	Elizabeth	TenEyck (?)			Daughter of Catherine		
4	Jennie (Jane)	Miller	1866		Daughter of Peter (2) adopted by Jacob (3)		

Hartgen performed deed research to reconstruct the ownership history of the property under study. The first deed found for this property equaling ± 200 acres was between brothers Peter and Jacob Houck, grantees and John Watts, grantor in 1793. This property was described in the deed as follows:

> as a part of a tract of land called Warrensborough and included within that tract therof which was heretofore sold and conveyed by Henry Gage & Susanna his wife & their trustees to the said party of the first part and is known in a map of the subdivision thereof made by John R. Bleecker Surveyor, in the year 1766, by Lot No. one hundred and forty seven…(Montgomery County Clerk 1793).

This area was referred to as Warrensborough in the eighteenth century (Sauthier 1779). Sometime between 1793 and 1839 Peter Houck granted his portion of this property to his brother Jacob Houck, although no deed has been found describing this transaction.

Jacob Houck married Christina Entis on January 27, 1799 according to a Dutch Reformed Church marriage record (Ancestry.com 2019a). Jacob died in 1839 granting this property to his eldest son, Isaac Houck. This transaction is described in great detail in his will executed on March 7, 1839. Also, in this will, Jacob Houck conveyed another piece of land to his two sons, Jacob and Isaac. The land was described as:

> A certain piece of land situated in Florida which has been for some years past in possession of James Greenman, Esq. containing about eighteen acres of Land, and bounded as follows, north by lands belonging to me, east by the George Servoss farm, south by the highway and west by James Greenmans land, the said Jacob and Isaac or the survivor of them shall whenever they shall deem it desired and proper to do to sell and convey the said land in fee simple, and out of the proceeds of said sale shall educate, support and maintain my grandson, Jacob A. TenEyck and if there be any surplus left pay the same to him when he arrives at the age of twenty one years. I give to my said grandson Jacob my silver watch, and it is my desire and I hereby request that my sons Jacob & Isaac shall take care of and provide of my said grandson until he shall arrive to an age when he shall be capable of taking care of himself. I do also order & direct that my son Isaac shall give my grandson Jacob a house when he arrives of age to be worth sixty or seventy dollars…(Ancestry.com 2019b).

This description fits the property under study perfectly when correlated with historic maps identifying the adjacent property owners. While the will specified that the sons can sell the land if wished, the fact that it remains identified as belonging to the Houck's into the 20th century indicates that they did not. It is unclear where the house that Jacob wanted constructed for his grandson Jacob TenEyck was located, or if it was even built. However, it does not appear to be the house being investigated. Indications are that the house under study was built near the time of the property transfer. But, it is not clear if it was before or after. Jacob Ten Eyck does not appear in census records relating to the property.

Isaac Houck and his wife, Catherine had two sons, Jacob and Peter. After the death of Isaac in 1850, this property was transferred to Isaac's son, Jacob Houck, although no deed or will record could be located explaining this transaction (Montgomery County History and Archives n.d.). Given the range of possible dates for the house under study, Jacob may have built it when he received the property. Jacob Houck maintained the ownership of this property from 1850 until his death in 1905. Jacob and his wife, Adeline had no children of their own. But, they are known to have adopted Jennie (Jane) Miller. A will for Jacob Houck was found which was executed on September 8, 1905 (Ancestry.com 2019c). Interestingly, their adopted daughter is not listed as a beneficiary.

The following table lists the chain of ownership for the project area from before 1793 to 1905.

Table 3. Summary of archeological site information collected during the Phase I survey

Date	Rec'd Date	Grantee	Grantor	Book, Page	Acres	$	Notes
Unknown	Unknown	John Watts	Henry and Susanna Gage				This transaction is described in Deed 4: Liber 257 when John Watts sold the property to Peter and Jacob Houck
21 September 1793	17 October-1793	Peter and Jacob Houck	John Watts	4:257	±200	800 pounds	
7 March 1839	7 March 1839	Jacob Houck	Isaac Houck				By will
8 September 1905	8 September 1905	Jacob A. TenEyck, Anna C. Hills, Ira Mann, Sophia Van Vechten, Remelia Young, Chester Lerudrum, Catherine Diety	Jacob Houck				By will, John P. Miller was executor; Isaac Van Vechten was administrator of goods

Census records have been consulted to determine the individuals present in both the Jacob and Christina Houck house. In addition, they provide critical information on tenants that would have occupied the rental properties owned by the Houck family. The first population record for Jacob Houck was in 1810 when he was between 25 and 45 years of age. At this time, he was living in the Jacob and Christina Houck House, east of the J. Houck Historic site. He was listed in the population census as living with one woman of the same age, four children and two slaves (United States Census Bureau 1810). By 1820, the population record listed him as living with one woman, five children/young adults, two slaves (one adult male and one young adult female), and one free African American female under the age of fourteen (United States Census Bureau 1820). This is the last census that shows the family owning any slaves. However, labor provided by African Americans remained important to the family's income. In 1830, Jacob Houck was between 50 and 60 years of age and lived with one woman of the same age, two young adult men, one boy, one young adult female, one girl, and one free African American male between 10 and 23 years of age (United States Census Bureau 1830). According to cemetery records, Jacob Houck died in 1839 (Montgomery County History and Archives n.d.).

By 1840, the ownership of the Jacob and Christina Houck House was transferred to Jacob's son Isaac Houck. In the 1840 population census, Isaac Houck was listed as the head of the family between the age of 30 and 40. He lived with one female the same age, four boys, 1 young adult female, three girls, and one female between 50-60 years of age (United States Census Bureau 1840). Christina Houck, the wife of Jacob and the mother of Isaac died in 1847 according to cemetery records (Montgomery County History and Archives n.d.).

In 1850, Isaac Houck was recorded at age 47 and living with his wife, Catherine, age 37. They had two sons, Jacob and Peter. 64 year old Maria Houck was living with them in this year (United States Census Bureau 1850b). Perhaps Maria Houck was Jacob's sister, but no documentation was found to support that assumption. In this year, Isaac Houck's farm was valued at $10,000 and he farmed 170 acres of land. His main crops were oats, rye, and corn. He had 9 horses, 4 milk cows, 9 beef cattle, 2 oxen, 34 sheep and 9 pigs. His livestock was valued at $718 (United States Census Bureau 1850a).

According to cemetery records, Isaac Houck died in 1850 (Montgomery County History and Archives n.d.). His son, Jacob, acquired the property of the Houck estate and was listed as the head of the household in the 1860 population census at the age of 27, living with his wife, Adeline. His brother, Peter, and his mother, Catherine also resided with him. An African American 16 year old boy named James Dennis, most likely a farm laborer also was listed in the household. After the analysis of the 1860 population census record, it was determined that African American John Miller and his wife Jane were living in the house at the J. Houck Historic Site. It is believed that John Miller who was listed as a farm laborer in the population census living directly adjacent positioned west of the Jacob and Christina Houck House, was working for Jacob Houck and living in this house on the Houck estate (United States Census Bureau 1860b). According to the 1860 agricultural census, the amount of land farmed increased to 264 acres, and the value of the farm increased to $16,000. The main crops in this year were oats and corn. The value of livestock increased to $1,400 which included 5 8 horses, milk cows, 20 beef cattle, 4 oxen, 45 sheep, and 5 pigs. John Miller was not listed in the agricultural census of this year considering only landowners appear to be recorded at this time (United States Census Bureau 1860a).

By 1870, James Dennis no longer lived at the household, but Jennie (Jane) Miller, a four year old girl lived with the family. It is believed that this child, Peter's daughter and later adopted daughter of Jacob, was a relation to John and Jane Miller who lived next door in 1860 (most likely the granddaughter of Jane Miller). John and Jane Miller were listed as living in a different area of the town of Florida according to the population census for that year. After an examination of the 1870 population records, it is thought that farmer, Loronzo Lisdell rented farm land from Jacob Houck as well as the house which stood at the J. Houck Historic Site. He was age 23 in 1870 and lived with his young wife, Anna and their daughter, Minnie. He is not recorded as owning any real estate in the population census, but having $100 for his personal estate. There is another young farmer who lived directly next door. 25 year old, Jay Burt was also most likely renting farmland from Jacob Houck. It is probable that he lived in what is known as the Houck Tenant Farmhouse which was situated directly west of the Jacob and Christina Houck House. Jay Burt lived with his young wife, Lydia and their 2 year old daughter, Amy (United States Census Bureau 1870b). Neither Loronzo Lisdell nor Jay Burt were listed in the 1870

agricultural census because they were not property owners. According to the agricultural census of this year, the Houck farm decreased in acreage down to 180 acres, but maintained the same value most likely because Houck was renting out approximately 85 acres of farmland. The main crop continued to be oats, with an increase on their wheat crop. The farm was still heavy with livestock maintaining 10 horses, 6 milk cows, 6 beef cattle, 2 working oxen, 23 sheep, 3 pigs, and 210 chickens (United States Census Bureau 1870a).

After the analysis of an 1875 state census record, it became clear that Jennie (Jane) Miller who was listed in the 1860 population census living with the Houck family was in fact Peter Houck's daughter (New York State Census Bureau 1875), likely with a daughter of John and Jane Miller. She is listed in the records as Jacob's niece. She was eventually adopted by Jacob and Adeline who had no children of their own, changing her name to Houck and eventually being buried in the family cemetery. By 1880, Peter and Jennie did not live at the Jacob and Christina Houck House. In this year, Jacob Houck and his wife, Adeline continued to live in the main house with Jacob's mother, Catherine. They had a female servant from Prussia living with them and two male farm laborers. It is believed that the two male farm laborers were living in the tenant farmhouse. Living directly next door to Jacob Houck was farmer, Timothy Fero and his family. It is very possible that the Fero family lived in the house which used to stand at the J. Houck Historic Site. In 1880, Timothy Fero was listed at age 44 and his wife, Dorcas, was recorded as age 48. The couple had two teenage children (United States Census Bureau 1880b). According to the 1880 agricultural census, Timothy Fero was renting 85 acres of farmland in that year. It is believed that Fero was renting farmland from Jacob Houck while living at the J. Houck Historic Site. 1880 was the first year that the census recorded if a farmer was the owner or renter.

Jacob Houck's farm increased in value between 1870 and 1880 by $6,000. His main crop was still oats, but did increase his buckwheat and corn crop. His wheat crop diminished from 200 bushels down to 18 bushels in that year. Houck had 6 horses, 5 milk cows, 7 beef cattle, 2 working oxen, 30 sheep, 5 pigs, and 120 chickens. Recorded immediately adjacent to Jacob Houck, was Timothy Fero in the 1880 agricultural census. Fero rented 86 acres of farmland from Houck in that year and his farm was valued at $9,000. His main crop was also oats, with his next largest crop being corn. He had 2 horses, 6 milk cows, 9 beef cattle, and 12 chickens. There are no later agricultural censuses available after 1880 (United States Census Bureau 1880a).

According to the 1892 state census, Jacob Houck and his wife Adeline were both 60 years old in that year, and his mother Catherine was 81. They had a seventeen year old female servant living with them, and an eighteen year old male laborer possibly living at the tenant farmhouse. It is believed that African American Benjamin Havens and his wife Grace Havens lived at the house at the J. Houck Historic site in this year. The state census does not distinguish between households as the federal census does, so it is unclear if they lived in a separate house from the Houck family (New York State Census Bureau 1892).

Catherine Houck died in 1898 reported by the New York State Death Index (Ancestry.com 2019d). In 1900, Jacob and Adeline Houck continued to occupy the Jacob and Christina Houck House. Living with them in this year was a young female servant and a young male farm laborer. Recorded living next door in the population census was John and Kate Miller. John Miller was listed as a 32 year old farm laborer who rented out the house which he occupied. It is supposed that he and his wife were living in the Houck Tenant Farmhouse at this time. William Sanders and his family was recorded living next to the Miller's. William Sanders was documented as a 40 year old farmer who rented out a house. Living with him was his wife, Amelia and their four sons. It is believed that the Sander family was renting out the house which used to be situated at the J. Houck Historic Site.

According to cemetery records, Adeline Houck, wife of Jacob Houck died in 1903 at the age of 70 and Jacob Houck died in 1905 at the age of 72 (Montgomery County History and Archives n.d.).

After the analysis of historical maps, it has been determined that the house which used to be situated at the J. Houck Historic site was demolished between 1905 and 1931, probably closer to the earlier date (Century Map Company 1905; USGS 1931).

The following table summarizes the known (or suspected) identities of the tenants renting either the Houck Tenant Farmhouse adjacent to the main house or the J. Houck Historic Site home that is the focus of this study

between 1860 and 1900. Due to the timing of censuses, it is likely that additional renters were present in the two properties which were not recorded.

Table 4. Summary of archeological site information collected during the Phase I survey

First Name	Last Name	Residence	Age	Census year	Occupation	Note
John	Miller	J. Houck Historic Site	45	1860	Farm laborer	African American
Jane	Miller	J. Houck Historic Site	45	1860		African American
Loronzo	Lisdell	J. Houck Historic Site	23	1870	Farmer	
Anna	Lisdell	J. Houck Historic Site	19	1870	Keeping house	
Minnie	Lisdell	J. Houck Historic Site	2	1870		
Jay	Burt	Houck Tennant Farmhouse	25	1870	Farmer	
Lydia	Loranzo	Houck Tennant Farmhouse	19	1870	Keeping house	
Amy	Burt	Houck Tennant Farmhouse	2	1870		
Benjamin	Haven	Houck Tennant Farmhouse	27	1880	Laborer	Presumably the same as the Benjamin "Havens" identified as an African American laborer in the 1892 census
John	Bickford	Houck Tennant Farmhouse	18	1880	Laborer	
Timothy	Fero	J. Houck Historic Site	44	1880	Farmer	
Dorcas	Fero	J. Houck Historic Site	48	1880	Keeping house	
Frank	Fero	J. Houck Historic Site	14	1880	At home	
Josephine	Fero	J. Houck Historic Site	12	1880	At home	
James	Dence	Houck Tennant Farmhouse	19	1892	Laborer	
Benjamin	Havens	J. Houck Historic Site	41	1892	Laborer	African American
Grace	Havens	J. Houck Historic Site	31	1892	Dress maker	African American
John	Miller	Houck Tennant Farmhouse	32	1900	Farm laborer	
Kate	Miller	Houck Tennant Farmhouse	30	1900		
William	Sanders	J. Houck Historic Site	40	1900	Farmer	

Amelia	Sanders	J. Houck Historic Site	39	1900		
Howard	Sanders	J. Houck Historic Site	14	1900	Farm Laborer	
Seymore	Sanders	J. Houck Historic Site	12	1900	At school	
Morris	Sanders	J. Houck Historic Site	9	1900	At school	
Erving	Sanders	J. Houck Historic Site	2	1900		

3 Archeological Site Evaluation

3.1 Methodology

3.1.1 Shovel Testing

Fifty-eight shovel tests were excavated at 8-meter (26 ft) intervals in the vicinity of the foundations and positive tests from Phase IB survey work with the goal of defining the site boundaries (Map 2). An additional 6 were excavated at 2 meter (6.5 ft) intervals in an attempt to locate a privy or other features north of the main structure. Each shovel test was 40 centimeters (16 in) in diameter. All excavated soil was passed through 0.25-inch hardware mesh and examined for both precontact (Native American) and historic artifacts. The stratigraphy of each test was recorded including the depth, Munsell color, soil description, and artifact content (Munsell Color 2000). The location of each shovel test was plotted on the project map. Test excavation was photographed.

3.1.2 Unit Excavation

A total of 9 units were excavated during Phase II study (Map 2 inset). Units were rectangular with dimensions of 1-by-1, 1-by-0.5 or 2-by-0.5 meters (3.3 by 3.3, 3.3 by 1.6 or 6.6 by 1.6 ft). Soil levels were excavated separately, and all excavated soil was passed through 0.25-inch hardware mesh and examined for both precontact (Native American) and historic artifacts. Soil depths, Munsell colors, textures, artifact content, and other relevant observations were recorded (Munsell Color 2000). Profiles and plan views were drawn when appropriate. The location of each unit was mapped with a Trimble GeoXH GPS unit and plotted on the project map. Unit excavation fieldwork and unit wall stratigraphy was photographed.

Units 1-3 were placed to provide information on the form and function of the visible foundations and an associated brick concentration along their west side. Unit 4 was located east of the visible foundations to examine a possible stone alignment. It indicated the possibility of a later addition extending beyond the visible foundations. As a result, we chose to place Units 5, 6 and 8 in locations that would help us define the boundaries of that possible addition. Unit 7 was placed at a surface midden southwest of the visible foundations, to determine if, like the midden materials inside of the main foundation, they indicated the position of an additional structure or other feature. Unit 9 was placed on the centerline of what we believe to be the rear of the structure in an attempt to detect a privy or other outbuildings.

3.1.3 Artifacts and Laboratory

As general procedure, all precontact (Native American) cultural material identified during the fieldwork are collected. Significant historic artifacts such as glass, ceramics, food remains, hardware, and miscellaneous items are collected. Coal, ash, cinder, brick, and modern materials are noted. Any artifacts collected are placed in paper or plastic bags labeled by provenience and inventoried in a bag list. Bags are numbered in the field and transported to the Hartgen laboratory in the Town of North Greenbush, Rensselaer County, New York, for processing.

Shovel test records and other provenience information were entered into a Microsoft *Access* database (Appendix 1). Artifacts were cleaned and cataloged. Cataloging entailed entering artifact provenience information, counts, weights, and descriptive information into the database (Appendix 2).

3.2 Results

The Phase II site evaluation was conducted Between December 24, 2018 and January 8, 2019. The field crew consisted of Thomas Boyd, Adam Gersten, John Ham, David Wendell and Amy Wilson. The weather was generally cold and dry, with occasional light snow. It did not negatively impact visibility, artifact recovery, etc.

Surface finds – A single large strap hinge (probably from a barn door) dating from the mid to late 19th century was recovered as a surface find during the Phase IB reconnaissance. An additional two, matching hinges were recovered during the Phase II investigations. All three were found in association with the foundation. However, it is unclear if they belonged to a structure on the site or were part of the post-occupational midden material found within the foundation. A large amount of midden material was found inside of the foundation as well as to the southwest of the structure. It was readily apparent from bottles within the two deposits that the first dates to the 1920's and the second to the 1930's. These findings were supported by additional material collected from Units 1 and 7.

Shovel Testing - A total of 64 additional shovel tests were excavated during Phase II. Fifty-eight of those were placed at 8 meter (26 foot) intervals surrounding the foundation, well and previous positive tests. Six tests at 2 meter intervals were excavated in a line extending north from the centerline of the stone foundations in hopes of locating a privy or other structure associated with the foundations. Twenty-nine planned tests located to the west of the area tested were not excavated as we judged that we had established the western boundary of the site with the tests that were already excavated.

Tests were excavated to an average depth of 42 cm. The typical stratigraphy was a dark brown or dark grey brown AP horizon silt loam plow zone (ranging from 20 to 53 cm deep) over a greyish or yellowish brown clay loam subsoil. Twenty-six of the tests were positive for historic materials including ceramics, glass, construction hardware, faunal bone, and shell among other items. The majority of the positive tests were located on the south side of the foundation and the well, in what we believe to be the front of the structure. Those tests located north of the features were generally all located within 16 meters of them. Phase I testing indicated that the site did not extend past the old path of Route 5S running east to west roughly 25 meters south of the structures. Based on the shovel testing the site is 56 meters long and 43 meters wide. The latest *terminus post quem* (TPQ) date of artifacts recovered from STP's was 1920 from a piece of colorless, embossed "Turner Brothers Co." glass bottle from Utica, N.Y.

Unit 1 – Unit was placed inside of the southwest corner of the foundation with the intention of identifying the floor level of the basement. Loose cobbles were removed from the surface of the location until a level containing midden artifacts was exposed (Photos 11-12). At that point, the unit was placed and that level was treated as the surface. It was excavated to an average depth of 27 cm in 2 arbitrary levels, until the unit filled with water and became unworkable (Photo 13).

The material recovered from unit 1 contained ceramics (including salt glazed stoneware, redware, whiteware, yellowware, ironstone, semi-porcelain and porcelain), Glass (window, bottle, vessel, lamp chimney and tableware), iron alloy nails (cut and wire), faunal bone (much showing cutting, sawing and other evidence of butchering), clam shell (some cut) and a variety of other artifacts including a metal spoon, a pocket knife, wire, Mason jar lids, a horseshoe, a porcelain doll head and carbon rods from alkaline batteries (Photos 14-32).

Much of the midden material appear to have been discarded in the 1920's based on the latest level 1/surface TPQ of 1923 from a kerosene lamp base (Photo 33). The deposit also contained a significant amount of earlier material with TPQ's as early as 1805 coming from grey bodied stoneware. These may have deposited at an earlier date, suggesting a long accumulation of material. However, based on their clear association with later materials, it seems more likely that they had been curated for some time before being discarded in a midden formed after the house was demolished. The cobbles above those materials were deposited sometime after the

formation of the 1920's midden deposit. The material from level 2 appears to be slightly earlier with the latest TPQ being 1905, the same year that the house was last shown on reliable historic maps. This suggests that the basement hole began being used as a dump soon after the structure was demolished. A large cut stone, fallen from the wall was also found in Level 2. Due to the flooding of the unit, we were not able to definitively identify the floor or define its depth below the surface.

Unit 2 – Unit 2 was placed outside of the southeast corner slightly overlapping the edge of the foundation wall to provide data on its construction and recover artifacts dating to the period of the structure's occupation (Figure 2). This unit, like Unit 3 was placed along the outside of the foundation, in what would have been an excavated construction trench. Excavation revealed the exterior of the foundation wall (Photos 34 and 35). Unlike the flat cut interior, the exterior was not finished. A large flat slab was located just below the surface. It appears that the slab is part of a pavement/floor also seen in Unit 6. This feature was constructed at a date later than the foundation itself, a fact supported by the recovery of an Indian head penny dated 1888 just below the slab (Photos 36 and 37). We currently hypothesize that this was the floor of an "L" shaped addition to the east and south sides of the existing structure. The unit was excavated to an average depth of 37 cm 1 cultural (to the depth of the slab) and one arbitrary level.

A well-provenienced sample of artifacts dating to the occupation period of the house was recovered from both above and below the slab floor. These included ceramics (including salt glazed stoneware, pearlware, whiteware and ironstone), Glass (window and bottle), iron alloy nails (cut and wire), a hand hammered iron alloy spike, faunal bone (some showing evidence of butchering), clam shell and other artifacts such as ball lay pipe fragments, a metal button, a fork, an iron alloy drawer pull, a bone utensil handle and the 1888 Indian head penny mentioned above (Photos 36-45).

Unit 3 – Unit 3 was placed along the exterior of the west wall over a concentration of collapsed brick and deteriorated mortar to determine the form of the fireplace, whether its chimney was exterior to the house or there was a flat fireback flush with the wall foundation. This unit, like Unit 2, was placed along the outside of the foundation, in what would have been an excavated construction trench. The first level of collapsed brick was difficult to remove, being frozen into the cold ground. Once this was removed, excavation was much easier. It was terminated in sterile subsoil (Level 4). The unit was excavated to an average depth of 68 cm in three arbitrary and one natural level. No external foundation was present below the brick pile, indicating that the fireplace and chimney would have been internal to the structure, exiting through the roof. One possible design, known as a Rumford fireplace, had a tall shallow firebox that both heated efficiently and reduced the smokiness of earlier designs. They were popular from their introduction in 1796 until the early 20th century.

A sample of artifacts was also collected from below the collapsed brick. This material included ceramics (including Salt glazed stoneware, whiteware, ironstone, America majolica and porcelain), Glass (window, bottle, jar and lamp chimney), iron alloy nails (cut), other iron alloy hardware (screw and bolt), faunal bone (some sawed), clam shell and a various other artifacts including ball clay pipe fragments, an iron alloy bracket, an iron alloy caster and wire fragments (Photos 48-55).

Because the bricks were associated with the hearth which appears to be original to the structure, we believe that the bricks themselves are good evidence for the initial construction date of the structure. Hartgen's architectural historian Walter Wheeler has examined a sample of complete bricks from the collapse feature and determined that they likely date between 1810 and 1830 based on the, dimensions, uniformity and quality of firing. The excavated artifacts also give us some idea of the construction date since they are from the construction trench. If we assume that a "Musterole" bottle (Photo 56) found near the surface is part of the post-occupation 1920's midden based on its 1926 TPQ, the oldest TPQ is in the 1850's from three fragments of refitting ironstone with a lily of the valley embossed motif (Photo 57).

Unit 4 - Unit 4 was placed to the east of the foundation to sample materials in a possible activity area between it and the well. We decided to place the unit in that specific location because it would expose a shallowly buried wall line which we believed may represent either a patio or an outer wall of a later house addition. At the unit was excavated, it was confirmed that the stones were the edge of a floor or patio, in this case, constructed of rounded cobbles, rather than flat slabs (Figure 3 and Photo 58). This floor was exposed in a single level

averaging 12 cm deep. The fill west of the rounded cobble edge was composed of angular limestone blocks. The southeast corner beyond the edge of the floor was excavated down to 46 cm.

A sample of artifacts was collected containing ceramics (whiteware), glass, (bottle and window), iron alloy nails, cut and wire), other iron alloy hardware (bolt and washer), faunal (some cut, burnt and/or calcined), clam shell, and other artifacts such as a .22 caliber copper alloy shell, a bone button and wire fragments (Photos 59-61).

Unit 5 – Unit 5 was placed to the south of the foundation and Unit 2 with the intent of locating the south wall of a possible patio or addition to the structure (Figure 3 and Photo 62). It contained a large, rectangular, cut, limestone block which we believe represents the south wall of the hypothesized addition. However, there were no stone paving slabs north of it, raising the possibility that it is not in situ. Work was terminated after a single arbitrary level reaching an average depth of 20 cm. A limited number of artifacts were recovered from the unit. These included a porcelain rim fragment, window glass, iron alloy nails (cut and wire), faunal bone (some cut) and clam shell (Photos 63-65).

Unit 6 – Unit 6 was placed to the east of the foundation and Unit 2 with the intent of defining the east wall of the possible patio or addition (Figure 4 and Photos 66 - 67). A layer of flat paving stones were exposed at about 20 cm deep. These stones covered the entire unit and it was not clear if we had exposed the edge. So, Unit 8 was placed along the east wall of the unit. Excavation of that unit showed that the edge of the pavement was contained to this excavation. Once documented, several of the slabs were removed and a second level was excavate below to acquire a sample of artifacts predating its construction.

Artifacts recovered from the unit included ceramics (redware, whiteware and porcelain), glass (window, bottle and vessel), iron alloy nails (cut and wire), a horseshoe fragment, iron alloy screw, faunal bone (some sawed), clam shell, as well as, an iron alloy strap and rod (Photos 68-71).

Unit 7 – Unit 7 was placed southwest of the foundation over a surface midden deposit, to test if that midden indicated the location of another historic structure (Figure 5 and Photos 72-73). The 1905 map indicated two structures in the area, likely a house and a barn. Previous surface survey did not locate a second structure. However, since the existing foundation had been used as a dump after the structure was abandoned, we hypothesized that the second midden may indicate the position of a second structure. The unit was placed half outside of the deposit and half inside in hopes of detecting any buried foundation. It was excavated to an average depth of 30 cm in two arbitrary levels. It was not excavated any deeper, because sterile subsoil had been encountered intact with no indication of features. It appears that this midden was created in the 1930's based on a TPQ of 1934 obtained from two RCA Cunningham radio vacuum tubes (Photo 74).

A sample of diagnostic artifacts was collected from the midden. It contained ceramics (including salt glazed stoneware, redware, whiteware, yellowware, ironstone and semi-porcelain), glass (window, bottle and vessel), iron alloy nails (cut), faunal bone (some sawed, burnt and/or calcined) and a variety of other artifacts including a cast iron toy car, an orange and white glass marble, Ball Mason jar lids, several leather shoes and boots (both male and female styles), a pair of scissors, a pair of pliers, iron chain and a Champion X spark plug of the type used in the Model T Ford (Photos 75-83).

Unit 8 – Unit 8 was placed immediately adjacent to Unit 6 to determine if a level of stone floor slabs continued to the east (Figure 4 and Photos 84-85). No additional paving was encountered. However the unit was excavated to an average depth of 55 cm in three arbitrary levels. A mix of artifacts were recovered which included ceramics (redware, whiteware and semi-porcelain), iron alloy nails (cut and wire), a bronze bell faunal bone (some sawed) and clam shells (Photos 86-90).

Unit 9 – Unit 9 was located along the centerline of the foundation on its north, presumed rear side of the structure in hopes of locating a privy or other outbuilding (Figure 5 and Photo 91). It was excavated to an average depth of 40 cm in two arbitrary levels. It was stopped at that depth because it had filled with water. No additional features were discovered. However, a sample of artifacts were recovered. These included ceramics (pearlware, whiteware, ironstone and semi-porcelain), glass (bottle, vessel and window), and sawed faunal bone (Photos 91-94).

Table 5. Summary of Phase II field investigations

Field method	Qty/Area	Rationale	Results
Shovel tests	64 tests	Conducted to determine the site boundaries and chronology	Site boundaries were established based in drop-off of archeological materials. TPQ dates had large range from 1780 to 1920 suggesting long term use of the site before and after residence was present.
Units	9/8.5 m^2	Conducted to investigate structure form, function and chronology	Some ambiguity remains about the form of the structure. Excavations suggested the visible foundation and cellar hole were the original structure dating between ~1820 and 1853 when it appears on the Geil map. It appears to have had at least one addition wrapping around the east and south sides added sometime after 1888.

3.2.1 Site Boundaries within APE

Shovel testing established site boundaries for the J. Houck historic site. It measures 56 meters long by 43 meters wide with a total area of 0.5 acres. See Map 1 for specific position within overall APE.

3.2.2 Site stratigraphy and Chronology

Shovel tests indicated that the site stratigraphy was reasonable uniform with an A horizon consisting of a dark grey silt loam with an approximate depth of between 20 and 55 cm. The B horizon was a yellowish or greyish brown clay silt mix. The soils were rather poorly drained owing to the clay in the B horizon. Units 2, 4 and 6 contained a man-made layer of floor slabs/cobbles that were likely placed on the existing surface at the time of construction which have since accumulated enough soil to be buried just below the present day surface.

Our initial indication of the date of the structure came from a sample of the collapsed bricks located along the west side of the structure whose attributes suggested a manufacturing date of ~1820 (between 1810 and 1830). However, the best archaeological indications of the chronology for the features come from two artifacts with clear dates. Three refitted ironstone ceramic sherds featuring an embossed lily of the valley motif dating from the 1850's or 60's was recovered in Level 3 of Unit 3 alongside the west foundation wall in a context that suggests it was deposited in the construction trench when the foundation was built. We know from the Geil map that the main structure was present by 1853, suggesting this would be an early example of the style. Feature 2, the floor in the structure's addition is securely dated as having been constructed sometime after 1888, the date on an Indian head penny located immediately below a large floor slab in unit 2, just south of the foundation wall.

We know that the structure was still present at the time that the 1905 century map was published and that it was demolished before the creation of the 1920's midden deposit in the cellar hole. Possibly not coincidentally, its owner Jacob Houck died in 1905.

3.2.3 Archeological Features

Table 6. Summary of archeological features

Feature	Function	Date	Integrity	Artifact content	Soil samples
1	Foundation/cellar hole	~1820-1853	Good	Early 20th century midden deposit	None
2	Floor (east and south side addition)	Post 1888	Good	Mix of typical domestic artifacts including ceramics, glass and faunal bone. Dated 1888 Indian head penny was found immediately below floor slab in Unit 2.	None
3	Well	~1820-1853	Good	Undetermined	None

Feature 1 was a readily visible cut stone building foundation and cellar hole (Figure 1). It measures 15' 8" by 16' 8" feet at the outside corners and is 1' 8" thick. It consists of irregular, cut limestone blocks. The interior surface has been dressed leaving an even flat wall. The exposed outer surface is irregular (Figure 2). A hearth or hearth support it set into the west wall extending like a shelf into the interior space. An adjacent concentration of bricks and mortar represents the collapsed chimney.

Feature 2 was a floor for what is currently believed to be a later "L" shaped addition to the structure which runs the length of the east side of the foundation (Feature 1) and wraps around the south side of the structure. It was first encountered in Unit 2 where it consisted of a large flat slab extending south from the foundation (Figure 2). The same flat slab construction was seen in Unit 6 (Figure 5). Unit 4 also contains a floor whose outside edge runs along the same line at the floor in Unit 6. However, its construction differs, consisting of a level layer of rounded cobbles forming the outer line with more irregular stone fill inside (Figure 3). This may indicate that the two sections were built at different times or had a different function (i.e. one being an internal floor surface and the other an external patio space). It is not currently known where one section ends and the other begins.

Feature 3 was a roughly 3 foot diameter well located ~ 40 feet northeast of the Feature 1 foundation and 30 feet northeast of the Feature 2 floor (Map 2). Attempts to collect a column sample of sediment and artifacts from the bottom failed because we encountered an obstruction. The well had been partially filled with the same cleared field cobbles found inside the main foundation up to a depth of about 5 feet below the surface.

3.2.4 Artifact Analysis

The artifacts collected during our investigation are consistent with an occupation lasting from the early to mid-19th century until the early 20th. There are two distinct midden deposits on the site, one from the 1920's and the other from the 1930's that postdate the occupation phase. There is no indication of disturbance of the site, suggesting that the site retains its integrity and has the potential to provide useful data. The artifact distribution is quite restricted with almost all recovered materials from both Phases I and II being restricted to a 33 meter (110 feet) radius around the structure foundations.

The collection is a typical domestic assemblage including ceramics, glass and food remains. The ceramic materials contain a mix of types including salt glazed stoneware, redware, yellowware, whiteware, ironstone and porcelain. The vessel forms are dominated by serving wares although some storage items such as jugs and crocks are also present. Much of the glass artifacts collected are bottles, from food and beverages, as well as, medicines/beauty products. There were also a significant number of glass serving wares in the collection. Construction materials (nails, hardware and window glass) were also well represented in the collection. The faunal collection contains many large mammal (cow and pig) bones with evidence of butchering and cooking. Interestingly, the elements that are present are generally not from the meatiest "best cuts" which may be a reflection of lower socio-economic status of the occupants, who sources indicate were renting the property from the Houck family. A number of commensal species (primarily rodents) were also recovered.

4 Interpretation

Table 7. Summary of archeological site information collected during the Phase I and II studies

Characteristic	Site information	Source of information
OPRHP Site No.	Not yet assigned	
Site Name	J. Houck Historic Site	
Description	Historic site consisting of a stone foundation and well. Artifacts included: The artifacts collected in this vicinity included 3 strap hinges, likely barn door hinges dating to the mid-late 19th century, and two pieces of unidentified wire hardware surface collected near the foundation remains. In addition to the surface artifacts, nearby shovel tests contained cut nails, handmade amber bottle glass, manganese solarized and embossed pale aqua vessel glass, faunal bone, and a variety of ceramics including redware, yellowware, whiteware, salt-glazed Albany slip stoneware, molded ironstone and porcelain. The metal strap hinge, cut nails, salt-glazed Albany slip stoneware, molded ironstone, and handmade amber bottle glass can be approximately dated to the mid- to late-19th century, a time period consistent with the occupation of the house according to historic maps. A 1888 dated Indian head penny recovered immediately below a floor slab provides a TQP date for construction of an addition to the original house. Some earlier artifacts such as ball clay pipe fragments suggests use of the site prior to construction of the foundations under study. Two midden deposits, one from the 1920's and the other from the 1930's were created after the demolition of the residential structure. The structure appears on historic maps from 1853-1905.	Historic maps, documentary research, artifact analysis and stratigraphy
Date	~1830-1905	Historic maps and artifact analysis
Function	Residential	Artifact analysis and architectural form
Size	0.5 acres	
Location	NAD 83, UTM Zone 18, 562724 Easting, 4753742 Northing	

5 Significance Assessment

The significance of the J. Houck Historic Site is assessed according to the National Park Service's *Guidelines for Registering and Evaluating Archeological Properties* (Little, et al. 2000). The site meets eligibility Criteria B "are

associated with the lives of persons significant in our past" and D for the National Register and has "yielded, or may be likely to yield, information important in prehistory or history."

The Houck family had significant local historic importance. They were important in the settlement and early development of the community of Florida, New York. The Houck family had its roots in Holland and by the late 18th century became successful farmers. The NRE Jacob and Christina Houck House was one of the largest and most costly in the town. The home was accompanied by a small family cemetery. This Jacob, the grandfather of our "J. Houck", moved from Schoharie to the Town of Florida in 1793 and served in several official positions in the community (Frothingham 1892). Jacob the grandson was born in Florida in 1832 and inherited the property from his father Isaac upon his death in 1850. Jacob's brother, Peter, who spent many years living at the Jacob and Christina House, served as a First Lieutenant in New York's 153rd Infantry Regiment during the civil war.

Several generations of Houck's owned and occupied the house while renting out two additional homes to tenant farmers, some of whom apparently worked for the Houck family. The J. Houck Historic Site was one of these rental properties. Examination of ceramics, food remains and other material found at this this site offers to the opportunity to explore comparisons and contrasts between life in the main house and life as a Houck tenant and laborer, specifically the chance to examine issues of economic production and consumption as well as social status and how it related to ethnicity. The existence of documentary sources, such as a series of agricultural censuses listing specific details about these farm properties, will allow an even more detailed and holistic analysis of these questions.

5.1 Significant research topics that can be addressed by site

The J. Houck Historic Site possesses data relevant historical development of the region. It has the potential to yield important information relating to household economics, in particular it offers the opportunity to reconstruct patterns of tenant household production and consumption. These patterns can be compared to those for the main, higher status, Houck property and other contemporary farmstead sites such as the nearby property belonging to the McClumpha family that was investigated by Ed Curtin (Curtin 2001, 2003), thereby providing a wider regional perspective. Additionally, as many of the documented tenants were African Americans, it can provide data useful in examining social organization of rural communities in the mid to late 19th century, in particular, questions relating to household status and ethnicity.

5.2 Integrity

The site retains important aspects of its integrity such as location, design and structure, physical setting, materials, workmanship, historical sense or feeling, and association between data and important research questions (Little, et al. 2000:35-38). The J. Houck Historic Site retains integrity with respect to the association between artifacts and important research questions. Despite the accumulation of midden deposits post-dating the occupation of the site, there is no indication of disturbance of the remains.

6 Recommendations

The J. Houck Historic Site contains significant archaeological data in undisturbed contexts. The property was owned by the locally important Houck family over several generations who used the site as a rental property. It was occupied by a series of tenants, many of whom worked as laborers for the Houck family. If the site cannot be avoided, phase III data recovery is recommended. In particular, additional units should be placed near the structure to more completely understand the form and construction history of the building and acquire a more robust sample of contemporary artifacts from good contexts. Those goals would also be served by digging a sump to lower the level of local ground water and allow excavation within the basement hole. The well should be bisected with a backhoe trench to determine if useful data can be acquired from below the layer of field cobbles currently preventing sampling. An area of approximately 20 meters around the house and well

should be mechanically stripped of soil in order to identify features such as middens or privies. If encountered, these features should be studied and sampled.

Photo 42. Hammered iron alloy spike (Unit 2, Level 1) (Bag 42, Item 14).

Photo 43. Metal button (Unit 2, Level1) (Bag 42, Item 11).

Photo 44. Fragment of metal fork (Unit 2, Level 1) (Bag 42, Item12).

Photo 45. Bone and iron alloy utensil handle with copper rivets (Unit 2, Level 1) (Bag 42, Item9).

Photo 46. View facing north of Level 1 of Unit 3 with adjacent foundation to the left.

Photo 47. View facing east of the base (Level 4) of Unit 3.

Photo 48. Fragment of salt glazed stoneware (Unit 3, Level 3) (Bag 45, Item 5).

Photo 49. Sample of whiteware (Unit 3, Level 2) (Bag 45, Item 1).

Photo 50. Sample of Ironstone (Unit 3, Level 2) (Bag 45, Item 3).

Photo 51. Fragment of American majolica (Unit 3, Level 2) (Bag 45, Item 4).

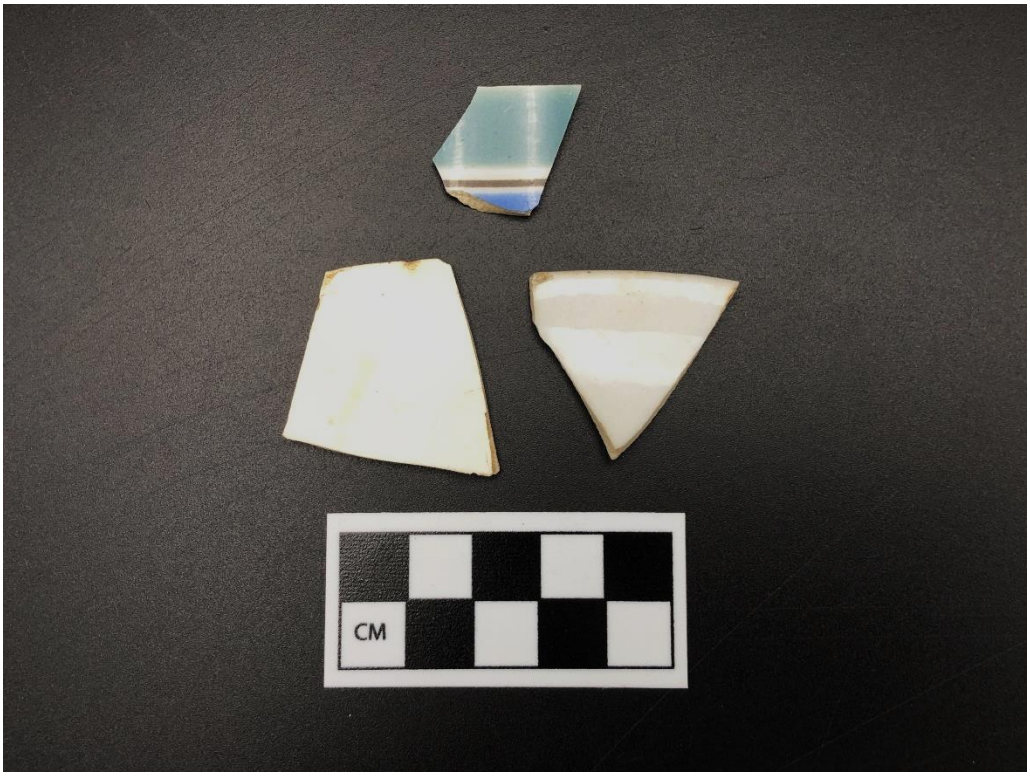

Photo 52. Sample of porcelain (Unit 3, Level 2) (Bag 45, Item 6).

Photo 53. Sample of iron alloy nails (Unit 3, Level 2) (Bag 45, Item 22).

Photo 54. Sample of faunal bone (unit 3, Level 2) (Bag 45, Item 26.6)

Photo 55. Metal caster (unit 3, Level 2) (Bag 45, Item 23)

Photo 56. Musterole jar with TPQ of 1926 (Unit 3, Level 1) (Bag 44, Item 2).

Photo 57. Fragment of ironstone plate with lily of the valley design which has a TPQ of 1850 (Unit 3, Level 3) (Bag 46, Item 3).

Photo 58. Photo facing west of the base of Unit 4, Level 2.

Photo 59. Glass mug/jug handle (Unit 4, Level 1) (Bag 47, Item 3).

Photo 60. Sample of faunal bone (Unit 4, Level 1) (Bag 47, Item 15).

Photo 61. Bone button (Unit 4, Level 1) (Bag 47, Item 6).

Photo 62. View facing north of Unit 5 containing large cut stone which may mark the south wall of the structure addition (note quarrying marks still visible below the surface).

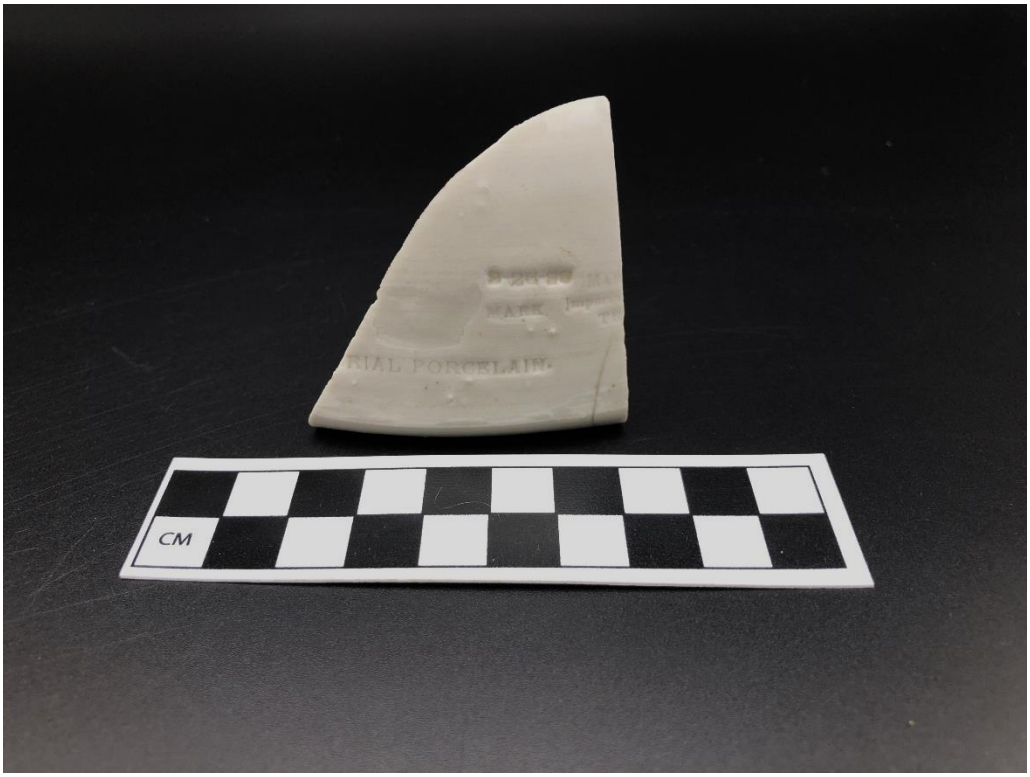

Photo 63. Fragment of porcelain (Unit 5, Level 1) (Bag 48, Item 1).

Photo 64. Sample of iron alloy nails (Unit 5, Level 1) (Bag 48, Item 3).

Photo 65. Sample of faunal bone (Unit 5, Level 1) (Bag 48, Item 5).

Photo 66. Photo facing east of base of level 1, Unit 6 showing pavement slabs.

Photo 67. Photo facing south of base of Unit 6 (with Unit 8 to the left).

Photo 68. Sample of whiteware (Unit 6, Level 1) (Bag 49, Item 1).

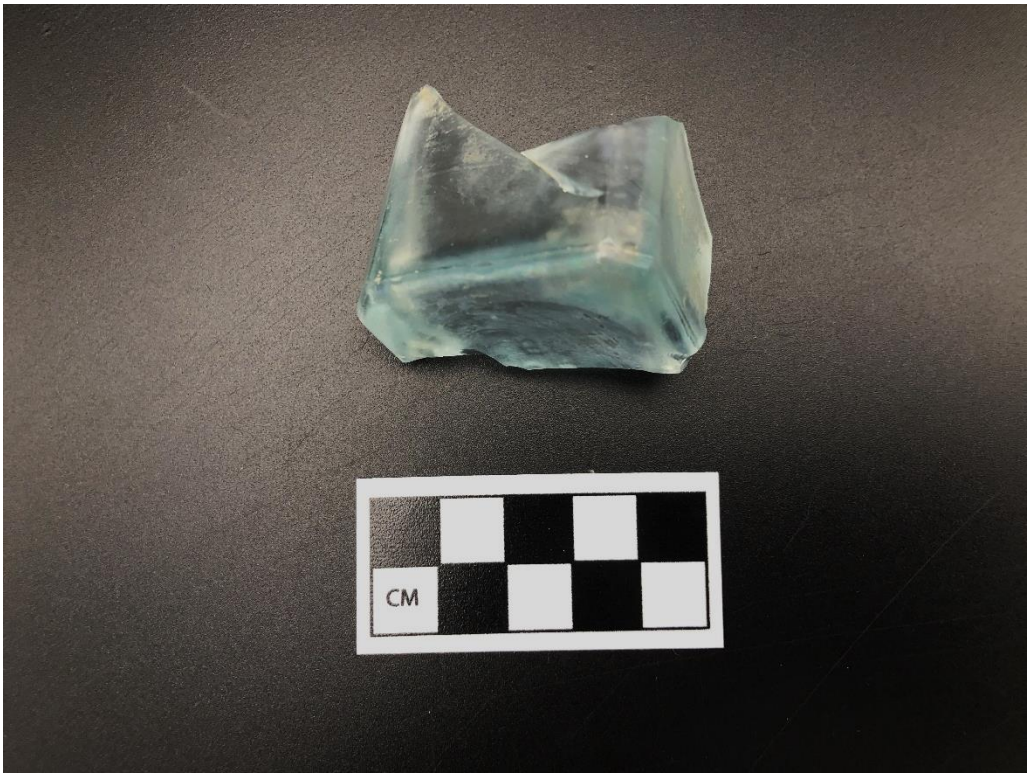

Photo 69. Fragment of aqua glass bottle (Unit 6, Level 1) (Bag 49, Item 2).

Photo 70. Portion of iron allow horseshoe with heel calk (Unit 6, Level 1) (Bag 49, Item 6).

Photo 71. Sample of faunal bone (Unit 6, Level 2) (Bag 50, Item 11).

Photo 72. View of base of Unit 7 facing south.

Photo 73. View of Unit 7 facing west.

Photo 74. RCA Cunningham radio vacuum tubes with a TPQ of 1935 (Unit 7, Level 1) (Bag 51, Item 37)

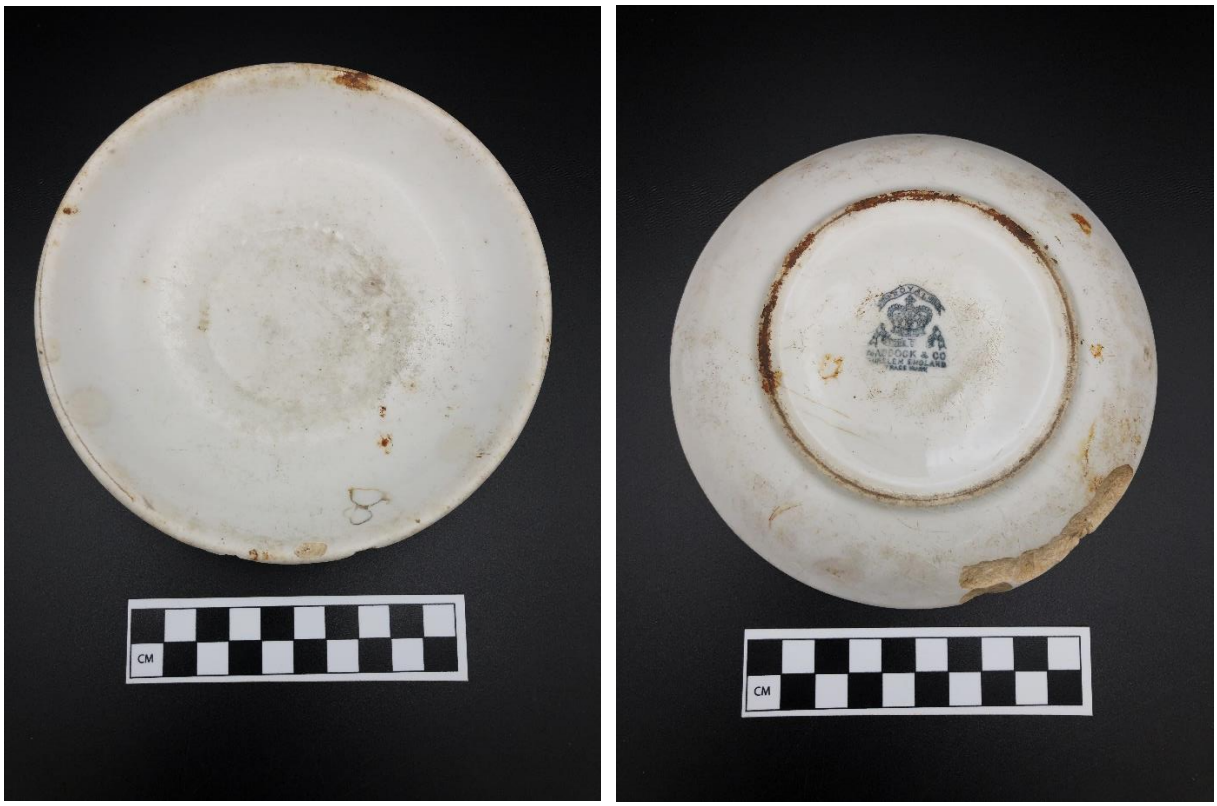

Photo 75. Ironstone saucer manufacture by Maddock and Co. (Unit 7, Level 1) (Bag 51, Item 1.1).

Photo 76. Fragments of a Hires Household Extract bottle (Unit 7, Level 1) (Bag 51, Item 6.1).

Photo 77. Fragment of E.J. Dossin bottle (Unit 7, Level 1) (Bag 51, Item 6.8).

Photo 78. Bottle of "Hair-Groom" with iron alloy razor blade stored inside (Unit 7, Level 1) (Bag 51, Item 7.1).

Photo 79. Cast iron car (possibly a Ford Model A taxi) with remnants of yellow paint (Unit 7, Level 1) (Bag 51, Item 16).

Photo 80. Orange and white glass marble (Unit 7, Level 1) (Bag 51, Item 13).

Photo 81. Iron alloy scissors (Unit 7, Level 1) (Bag 51, Item 29).

Photo 82. Screw top cap from a bottle marked American Medicinal Spirits Company (Unit 7, Level 1) (Bag 51, Item 32).

Photo 83. Champion X sparkplug, the type used in the Ford Model T ((Unit 7, Level 1) (Bag 51, Item 36).

Photo 84. Photo facing south of Units 6 (right) and 8 (left).

Photo 85. Photo facing south of Units 6 (right) and 8 (left).

Photo 86. Sample of whiteware with red transfer print (Unit 8, Level 3) (Bag 55, Item1).

Photo 87. Sample of iron alloy nails (Unit 8, Level 2) (Bag 54, Item 4).

Photo 88. Bronze bell (Unit 8, Level 1) (Bag 53, Item 2).

Photo 89. Sample of faunal bone (Unit 8, Level 2) (Bag 54, Item 6).

Photo 90. Sample of faunal bone (Unit 8, Level 3) (Bag 55, Item 4).

Photo 91. Base of Unit 9 facing east.

Photo 92. Sample of pearlware, some shell edged (Unit 9, Level 1) (Bag 56, Item 1).

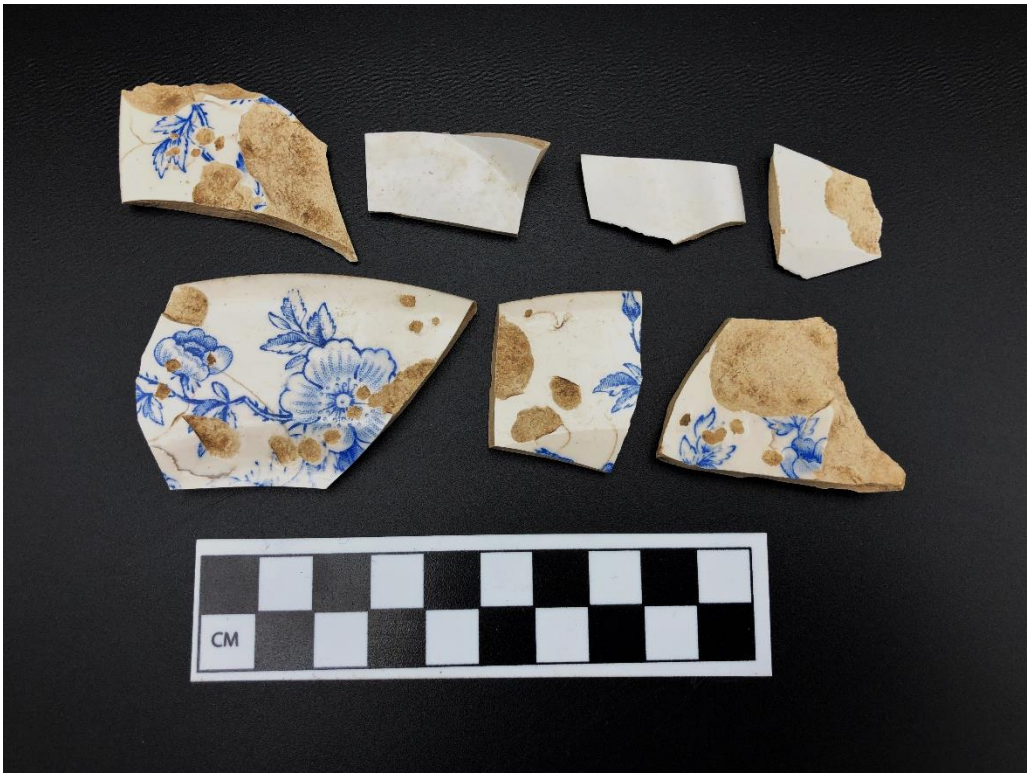

Photo 93. Sample of semi-porcelain (Unit 9, Level 1) (Bag 56, Item 4).

Photo 94. Sample of faunal bone (Unit 9, Level 1) (Bag 56, Item 11).

MANAGEMENT SUMMARY

SHPO Number:	*19PR04728*
Involved Agencies:	*United States Army Corps of Engineers*
Phase of survey:	*Phase III Data Retrieval*

LOCATION INFORMATION

Municipality:	*Town of Florida*
County:	*Montgomery*

SITE INFORMATION

Site Name:	*J. Houck Historic Site (05704.000188)*
Site Size:	*3,437 m2 (37,000 ft2)*
Mechanical Stripping:	*511 m^2 (5,500 ft^2, or 0.13 acre)*
Trenches:	*3 trenches, cumulative area 26 square meters (280 ft^2)*
Units:	*8 units, cumulative area 8 square meters*
Features:	*3 features identified, 3 of which were investigated*
Total Area Excavated:	*545 m^2 (5866 ft^2, or 0.13 acre)*

SUMMARY

The Houck family were important in the settlement and early development of the community of Florida, New York, first recorded as purchasing the property in 1793. The Houck family owned and farmed their property for over 100 years, relying on additional labor from tenant farmers for much of this time. Previous archeology conducted at the Houck Farmstead and Cemetery (OPRHP A05704.000119) and several other contemporary tenant farmsteads allowed for some interesting regional comparisons.

The J. Houck Historic Site is the second of two tenant farmhouses on the property. The first is situated near the main house, while the J. Houck Historic Site is located southwest of the main farmhouse. The J. Houck Historic Site consists of three main features, the original stone cellar footprint, an L-shaped addition to the east, and a stone well that is likely contemporary to the original stone cellar.

In general, tableware and other goods recovered from the site, in addition to food remains were of low to moderate economic value. Faunal analysis indicated that occupants consumed a varied diet of cow and veal, pig, sheep, various birds, fish, and clams, likely supplemented with the variety of crops produced on the farm, including fruits from a small orchard. The economic values of various cuts of meat studied during this survey ranged from low to high, but generally fell within the moderate range.

Historic cultural materials recovered from the site, in conjunction with numerous historical records about the Houck family and their various tenant occupants, provide valuable information and insight into the lives of rural tenant farmers and their landlords in the region throughout the 19th century.

Report Authors:	*Elizabeth Gregory, Matthew J. Kirk, RPA, Walter R. Wheeler*
Date of Report:	*13 July 2022*

Figure List

Figure 1. Overlay showing the Houck Farmstead and Cemetery, as mapped in 2002, placed over an aerial image dating to 1995 (courtesy of Google Earth). The J. Houck Historic Site, the focus of the current study, is situated southwest of the Houck Farmstead and Cemetery.

Figure 2. Map of the Fossgate/Houck Farmstead [*sic*] and Cemetery shown in the overlay in Figure 1, as recorded in the spring of 2002. This image was published in Hartgen's 2008 survey. The J. Houck Historic Site, the focus of the current study, is situated southwest of the Houck Farmstead and Cemetery and does not appear on this map.

Figure 3. Illustration of the Houck farmstead published in 1878 (F. W. Beers & Co. 1878).

Figure 4. Photograph from the 2002 report showing the Houck farmhouse prior to its removal. View looking northeast (Hartgen Archeological Associates 2002).

Figure 5. 1766 Bleeker *Map of Warrensburg Laid into lot in the year 1766* (Bleeker 1766).

Figure 6. 1779 Sauthier *A Chorographical Map of the Province of New York in North America* (Sauthier 1779).

Figure 7. Houck House on 1766-1795 Warrenbush map. Underlay image courtesy of Google Earth. Note the tenant house is at the very southwest extent of the farm lot. The Houcks owned Lot 147 (lot numbers are upside down in this view).

Figure 8. Undated photograph of James Dennis in uniform, published in the *Amsterdam Evening Recorder*. The caption notes that "he is thought to be the only colored veteran in Montgomery county" (Montgomery County Historical Society).

Figure 9. A dog collar was recovered during mechanical excavations of the well (Item 99.1).

Figure 10. A part of a sewing machine foot pedal mechanism was recovered from Trench 3 (Item 108.8).

Figure 11. Sewing machine foot pedal was recovered from Unit 12 (Item 65.15).

Figure 12. A variety of buttons were recovered throughout the site. Front (top photo) and rear (bottom photo) views. Top row (from left to right): Items 82.4, 86.4, and 86.5; Bottom row (from left to right): Items 59.7, 68.8, 69.8, 86.6, and 116.6.

Figure 13. Residences of Benjamin and Grace Havens between 1893 and 1901. Base imagery courtesy of Google Earth.

Figure 14. Children's toys collected during Phase III archeological investigations at the J. Houck Historic Site. Top, unglazed and decorated porcelain marble (Item 76.4); Bottom, bisque doll parts from left to right, Items 69.12, 89.3, and 75.7.

Figure 15. Architectural artifacts by type, as collected during Phase III archeological investigations.

Figure 16. Architectural elements collected during Phase III investigations included (top left) a finial from Level 1 of Unit 16 (Item 80.9), (top center) door hardware from Level 3 of Unit 16 (Item 86.13), (bottom left) an unidentified architectural element from Level 1 of Unit 16 (Item 80.11), (bottom center) a possible handle from Level 1 of Unit 17 (Item 90.11), and (right) a lock/lock part (latch type) from Level 1 of Unit 17 (Item 91.12).

Figure 17. Trench 2 produced a slate fragment, while a fragment of dressed stone was recovered from Trench 3.

Figure 18. The distribution of architectural artifacts by provenience. The majority of architectural materials were recovered from Units 15 and 16.

Figure 19. Horseshoes recovered from Unit 17 and Trench 3 included a horseshoe with a toe calk for traction and medial heel calk (Item 106.5, left), a narrow horseshoe with a heel calk (Item 91.11, middle), and an additional horseshoe from Unit 17 (Items 91.11, right).

Figure 20. This whetstone was recovered during stripping north and west of the house (Item 115.5).

Figure 21. Three examples of different bottle finishes represented in the artifact assemblage. Top: complete brown glass bottle with applied finish, c. 1830-1885 (Item 80.1.1), bottom left: machine-made brown glass bottle finish, TPQ 1899 (Item 80.1.3), and bottom right: pale aqua lipping-tooled glass bottle finish, c. 1885-1910 (Item 75.3).

Figure 22. Samples of some of the olive glass recovered from Level 2 of Unit 16 (Item 85.1).

Figure 23. Examples of diagnostic pharmaceutical bottles, including (top) a bottle embossed with "Kennedy's… /Kingston, N.Y. U.S.A." from Level 2 of Unit 11 (Items 62.5), (bottom left) "Chas. H. Fletchier's" castoria medicine bottle from Trench 3 (Item 105.5), and (bottom right) a Knox Bottle Co. vessel with "Dr. Edward A/ Bogdan/58 Church St./Amsterdam, N.Y./Phone 126" acid etched on the bottle, recovered from the stripped area (Item 112.2).

Figure 24. Examples of food and beverage-related glass containers recovered throughout the site. From left to right, a machine-made "Pride of the Farm/Tomato Catsup" bottle from the stripping area (Item 113.2), an embossed "American Soda Fountain Co" bottle from Level 2 of Unit 16 (Item 82.1), an embossed "Colton's/Select/Flavors" extract bottle from Level 2 of Unit 11 (Item 62.5), and an embossed wine bottle base manufactured by the Owens-Illinois Glass Co. from the stripped area (Item 116.2).

Figure 25. Two C. 1900-1925 milk bottles, embossed with "ONE QUART/ STEPHEN COLLINS/ ELMWOOD FARM/ AMSTERDAM N.Y./ REGISTERED," were recovered from Trench 3 (Item 106.2, left, and 108.3, right).

Figure 26. Quantities of ceramics by type as catalogued during Phase III archeological investigations at the J. Houck Historic Site.

Figure 27. A variety of ceramic artifacts were recovered throughout the site, including these examples of decorated whiteware (Items 65.1, left) and semi-porcelain (Item 65.2, right) recovered from Level 1 of Unit 12.

Figure 28. A variety of ceramic artifacts were recovered throughout the site, including these examples of decorated whiteware recovered from the stripped area north and west of the foundation. From left to right, a cobalt blue flow transfer printed rim with molded decoration including beading, lines, and stars (Item 111.1.1), a decorated and lightly impressed shell edged rim sherd (Item 111.1.2), a whiteware rim with molded decoration (Item 111.1.3), a polychrome saucer (Item 111.1.4), and a decorated polychrome rim sherd (Item 111.1.5).

Figure 29. Variety of decorated whiteware collected from Level 2 of Unit 13, top two rows (Items 68.1), and Level 4 of Unit 14, bottom row (Item 73.1).

Figure 30. Two fragments of yellowware were collected during Phase III investigations, including a milk pan fragment from the stripped area (Item 111.3, left) and a dipped polychrome fragment with dendritic decoration recovered from Level 4 of Unit 14 (Item 73.3, right).

Figure 31. A variety of stoneware was recovered throughout the site. From left to right, top: gray-bodied salt-glazed stoneware exterior (Item 111.5) and slipped interior (Item 65.3), and Albany slip and salt-glazed

stoneware interior and exterior (Items 111.6); Bottom: Gray-bodied slip decorated hollowware body (Item 58.2), and salt-glazed buff/pink bodied stoneware jug exterior and slipped interior (Items 62.4.2).

Figure 32. Several fragments of Nathaniel Hudson stoneware are represented in this photo, included base fragments from Bag 57.3 (top left), a piece of a handle from Bag 62.4.1 (bottom left), two body fragments from Bag 62.4.3 (right). Note the inscription on the central body fragment. Note the metallic sheen to the slip.

Figure 33. Fragments of an unglazed buff/pink bodied stoneware pie plate were recovered from the northern portion of the original house footprint (Items 104.2 and 107.1).

Figure 34. Makers' marks were identified on some of the ceramics recovered from the site, including this white-bodied refined earthenware sherd from the stripped area (Item 111.2, left) and this ironstone fragment from Trench 2 (Item 102.2, right).

Figure 35. Distribution of ceramics recovered throughout the J. Houck Historic Site by Unit (U), Trench (T), and stripping area (GP).

Figure 36. This c. late 19th century enameled teapot spout was recovered from Level 1 of Unit 17 (Item 92.5). Similar items were observed in the 1897 Sears Roebuck Co. catalog.

Figure 37. Coffee grinder recovered from the J. Houck Historic Site (Item 120.1, top) and a similar A. Kenrick & Sons cast iron and brass coffee mill grinder from an Etsy listing (bottom image courtesy of PaintedLadyAntiques, etsy.com).

Figure 38. Coffee grinder metal tag recovered from Unit 17, c. 1815-1830 (Item 92.4, left) and example of a similar A. Kenrick and Sons coffee mill tag from an Etsy listing (right image courtesy of PaintedLadyAntiques, etsy.com).

Figure 39. Distribution of food remains, including clam shell and faunal bone, recovered throughout the J. Houck Historic Site during Phase III archeological investigations.

Figure 40. Faunal bone collected from Level 1 of Unit 12 included cow, pig, unidentified medium mammal, and duck remains (Items 65.10).

Figure 41. The most common type of food remains recovered during Phase III archeological investigations were cow bone, such as these samples from the stripping area (Items 113.3). Some bone, including two samples seen here, showed cutting, sawing, and other evidence of butchering.

Figure 42. Two samples of clam shells recovered from Level 1 of Unit 12 (Item 65.11).

Figure 43. Intrusive wildlife remains were found in several contexts, including five striped skunk bones in Unit 15 (Item 74.5). Unit 15 also contained the remains of an unidentified large mammal, an unidentified medium mammal, and a pig.

Figure 44. These faunal remains recovered during excavation of Trench 3 consisted primarily of cow, but also included chicken, an unidentified large bird, and intrusive wildlife New England cottontail (Item 105.10).

Figure 45. Some smaller faunal bones, including bird and fish remains, were collected from the stripping area north and west of the foundation (Items 112.10.2).

Figure 46. Three cow bones were analyzed from Unit 17 including two loin steaks, top, and a cut for short rib stew, bottom (Item 91.27). The bottom sample is sawed and shows evidence of gnaw marks from a rodent.

Figure 47. Most cuts fell into the medium to low value range, and primarily consisted of larger cuts of meat.

Figure 48. Most cuts of pork fell into the low economic value range and included three "trotter" stew cuts and two "head" processed cuts.

Photograph List

Photo 1. Archeologists excavate Units 12 and 13 near the Houck house foundation. Unit 10 is visible in the foreground. View looking southeast.

Photo 2. Unit 10 was excavated in the northeastern corner of the foundation. The stratigraphy visible in this unit was fairly consistent throughout the interior of the foundation. View looking northwest.

Photo 3. The stratigraphy east of the foundation, within the northern portion of the addition, consisted of a thin layer of topsoil atop redeposited field cobbles. The soils beneath the cobbles consisted of a very dark

grayish brown silty loam underlain by a light olive brown silty loam subsoil. No living floor or substantial foundation remains were observed within the addition. View looking northwest.

Photo 4. Trench 1 was excavated to bisect the well, remove the cobble fill, and investigate any potential deposits within this feature. Although mechanical excavations were able to reach the base of the well, no significant cultural materials were recovered from the feature. View looking south.

Photo 5. Upon completion of the documentation, the well excavations (Trench 1) and Unit 11 were backfilled. View looking south.

Photo 6. Excavation of Trench 2, within the house addition. An intrusion into the topsoil consisting of cobbles amid darker soil, running generally in a north-south direction, indicated a possible exterior wall or edge of the addition. View looking north.

Photo 7. The north wall and a portion of the west wall were exposed after mechanical trenching. The depth of the foundation was relatively shallow and may have indicated the presence of a crawl space rather than a full cellar.

Photo 8. An archeologist inspects the stripping area west of the original house foundation. View looking north.

PHASE III DATA RETRIEVAL

1 Introduction

Hartgen Archeological Associates, Inc. (Hartgen) conducted a Phase II archeological site evaluation of the J. Houck Historic Site, which is located within the Area of Potential Effects (APE) for the proposed Winstanley Distribution Center project in the Town of Florida, Montgomery County, New York.

The proposed Project entails the removal of existing structures and the construction of a 750,000 to 1,000,000 square-foot distribution center, parking, access roads, storm water management areas, and utility lines. The total property acquisition includes approximately 140 acres.

This investigation was conducted to comply with Section 14.09 of the State Historic Preservation Act and will be reviewed by the New York State Office of Parks, Recreation and Historic Preservation (OPRHP). The investigation was conducted according to the New York Archaeological Council's *Standards for Cultural Resource Investigations and the Curation of Archaeological Collections* (1994), which are endorsed by OPRHP. This report has been prepared in accordance with OPRHP's *State Historic Preservation Office (SHPO) Phase I Archaeological Report Format Requirements* (2005).

2 Background

Hartgen Archeological Associates, Inc. completed the Phase III fieldwork for the proposed Winstanley Distribution Center/Interchange 27 Warehouse Project (Project) located at New York State Bicycle Route 5 and Mead Road in the Town of Florida, Montgomery County, New York (Map 1). The data retrieval fieldwork was completed between November 30 and December 16, 2020, and included shovel testing, unit excavations, and mechanical stripping to locate and record archeological features and deposits.

The Phase III research design, work scope, and analysis was based on current site conditions and on data collected from the Phase I and II archeological investigations completed by Hartgen in January 2018 and March 2019. Hartgen completed a Phase I archeological survey of the Project and identified the J. Houck Historic Site (05704.000188), constructed between 1820 and 1830, and occupied by tenant farmers throughout the 19th century. The site was abandoned in the early 20th century.

The J. Houck Historic Site is situated in a wooded section of the APE along the original route of State Highway 5S, which has since been rerouted to its current configuration to the north of the Project. The site consists of the remnants of a single-family residential structure and an associated well. The archeological footprint of the residence consists of a stone foundation with a cellar hole, a collapsed brick fireplace back associated with a stone hearth built into the stone foundation, and what appears to be an L-shaped addition along the east and south sides of the structure.

The addition was built sometime after 1888 based on the date of a coin found just below the stone floor slabs. The well is stone-lined and still contained water during the Phase I and II archeological surveys but was dry during the Phase III data retrieval. The property was owned by the locally important Houck family over several generations, who used the site as a rental property. It was occupied by a series of tenants, many of whom worked as laborers for the Houck family.

The artifacts collected during our investigation are consistent with an occupation lasting from the early to mid-19th century until the early 20th century. The collection of domestic materials includes ceramics, glass and food remains. Additionally, there are two distinct midden deposits on the site, one from the 1920s and the other from the 1930s, which postdate the occupational phase. The 1920s midden deposit is located within the cellar hole.

2.1 The Houck Farmstead and Cemetery (OPRHP A05704.000119 and A05704.000121)

The Houck Farmstead (also known as Farm Complex 2 in earlier archeological literature) consists of five distinct aspects:

- The Houck farmhouse (1793-2005);
- The Houck Tenant farmhouse (???-2006);
- The Houck family cemetery (1800-present);
- Various agricultural outbuildings (1793-2006);
- The J. Houck Historic Site (also a tenant residence) (1850-1930s).

Previous archeology and cultural resource management focused on the first four cultural resources. The current study is concerned with the fifth. A review of the previous archeology presented here provides a broader context for the history of the farmstead and the associated archeological investigations. Archeology was previously conducted in advance of improvements to Route 5S and the development of the former farm parcel for warehouse and storage facilities.

Figure 1. Overlay showing the Houck Farmstead and Cemetery, as mapped in 2002, placed over an aerial image dating to 1995 (courtesy of Google Earth). The J. Houck Historic Site, the focus of the current study, is situated southwest of the Houck Farmstead and Cemetery.

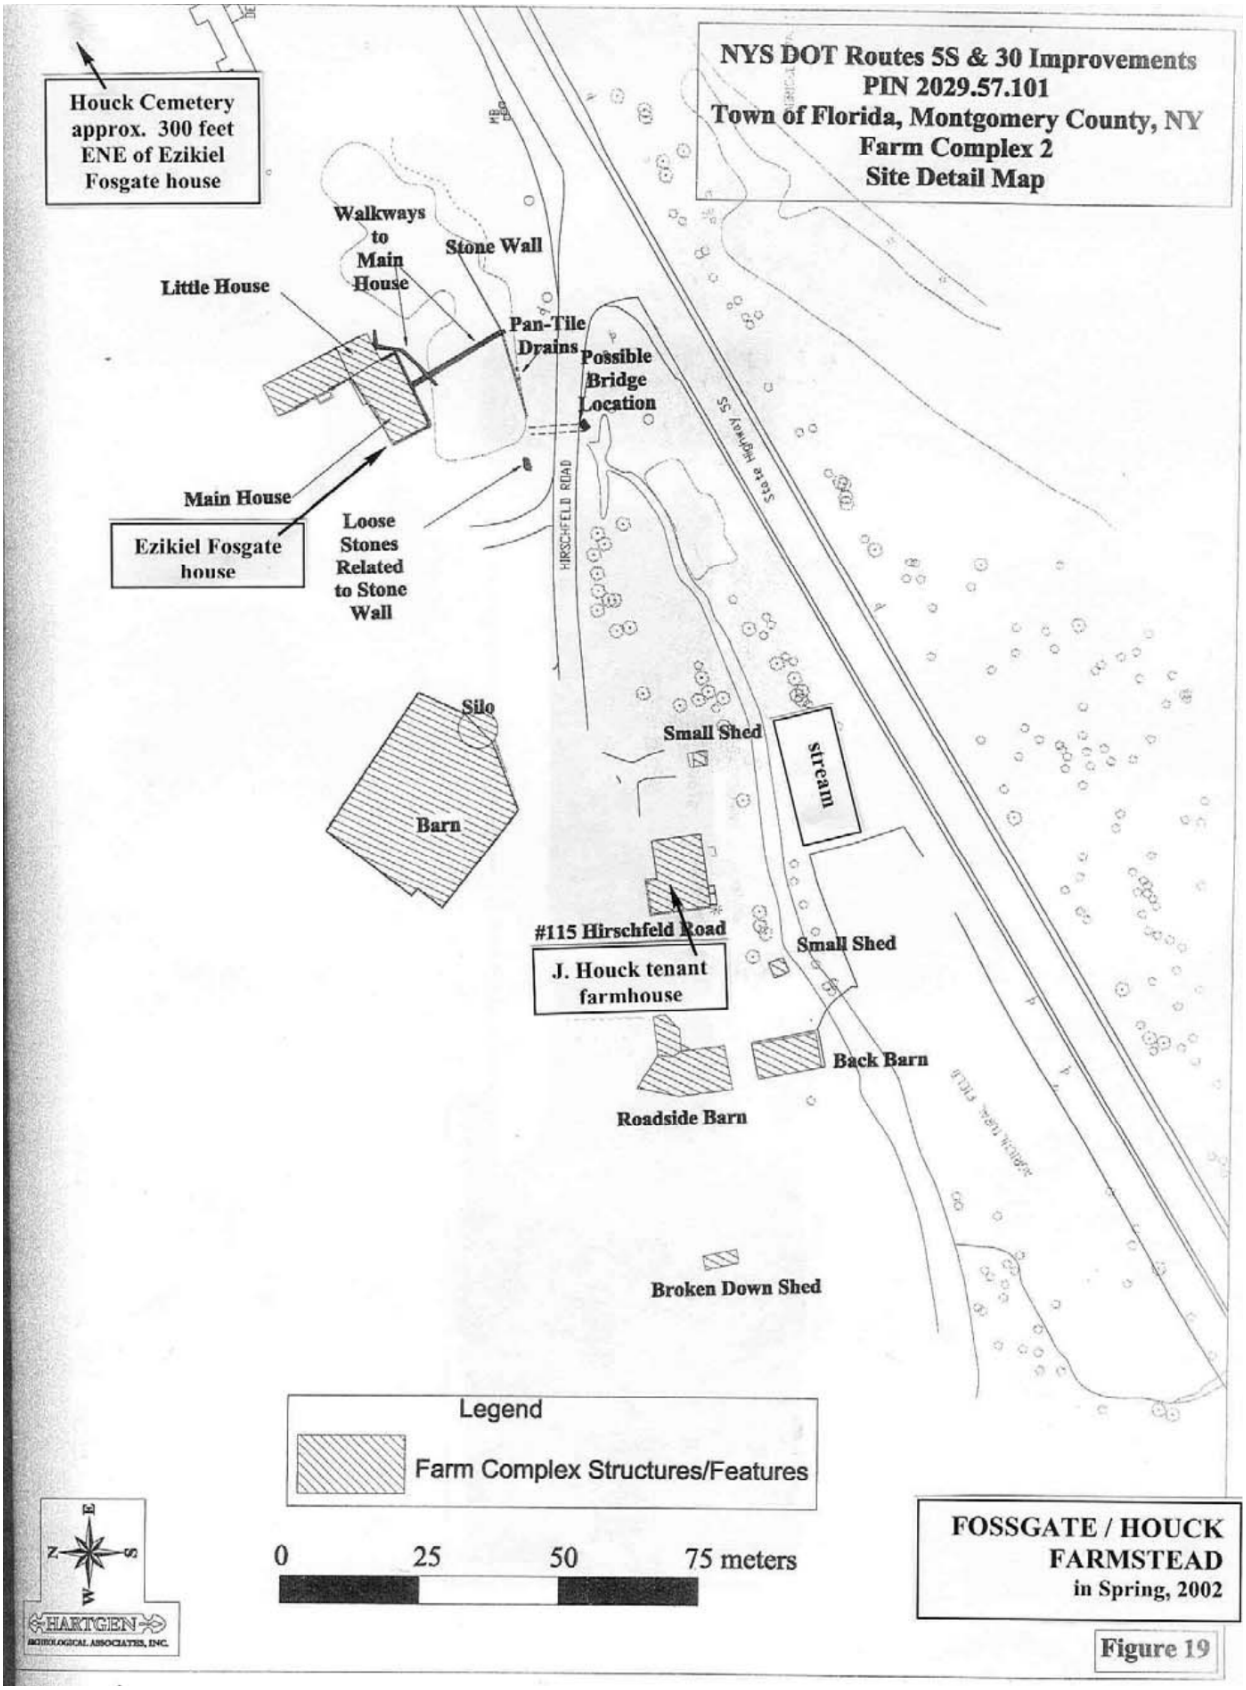

Figure 2. Map of the Fossgate/Houck Farmstead [*sic*] and Cemetery shown in the overlay in Figure 1, as recorded in the spring of 2002. This image was published in Hartgen's 2008 survey. The J. Houck Historic Site, the focus of the current study, is situated southwest of the Houck Farmstead and Cemetery and does not appear on this map.

This site was initially identified and reported during a 2002 NYSDOT-sponsored archeological survey conducted by Hartgen Archeological Associates (Hartgen Archeological Associates 2002). The site identified as Farm Complex 2 (Houck Farm) was assigned an OPRHP site number of A05704.000121 and a NYSM number of 11242. At the time of the survey, two houses (the Jacob and Christina Houck farmhouse and the J. Houck tenant house), three barns, and at least three small sheds stood on the site. The Jacob and Christina Houck house, situated on the north side of Hirschfeld Road, was assigned an OPRHP site number of 05704.000119. The J. Houck tenant farmhouse was on the south side of Hirschfeld Road. Both structures were situated within the Houck Farmstead and Cemetery site. The Houck Farmstead and Cemetery is approximately 5.2 acres (2.1 ha) in extent.

In 2005, the Jacob and Christina Houck farmhouse was dismantled by Windy Hill Restorations of Palatine Bridge, New York, with a view toward its eventual reconstruction elsewhere, although this has not occurred as of the writing of this report. The terms of the deconstruction of the house are given in an August 18th letter of resolution between New York State OPRHP and the Montgomery County IDA. One of the terms was that the house's cellar hole be filled to grade with clean fill from outside the site. This appears to have been accomplished. Concomitant with the dismantling of the Jacob and Christina Houck farmhouse, all the other buildings at the Houck farmstead site were demolished. As of 2008, only the cemetery remained. The initial form for the site, written in 2002, was based upon incomplete research and misidentified the original owners of the house as the Fossgate family. Excluding that erroneous conclusion, that form (A05704.000121) reads in part:

> The Fossgate/Houck Farm [*sic*]
>
> A Farm Complex situated at the intersection of Hirschfeld Road and SR 5S in the Town of Florida, Montgomery County, New York was investigated as part of PIN 2029.57.101 for the New York State Department of Transportation in the spring of 2002 (see site map). The site encompasses approximately 35,664 square meters.
>
> Surface reconnaissance of the site revealed a stone wall, steps and walkway in the front yard of a farmhouse, surrounded by associated barns and sheds, with an additional house across the road between Hirschfeld Road and SR 5S, and a little house joined to the east wall of the main farmhouse. Although many of the elements of the main house have been modified, a relatively early date of construction was discerned from the intact elements. A single shovel test excavated in the highway right-of-way recovered artifacts include two creamware sherds, a redware sherd, 43 whiteware sherds, window and bottle glass, three tobacco pipe fragments, a silver-plated spoon, brick, nails, and other unidentified hardware.
>
> …J. Hawke [*sic*] is indicated as the property owner on the 1853 Map of Montgomery County (Griner and Smithy), showing one of the varied family name spellings on different maps.
>
> The Houck family developed the property considerably, as the 1855 agricultural records lists a variety of goods including hay, grass seed, winter wheat, oats, barley, buckwheat, corn, potatoes and apples. Animals raised on the farm included sheep, cows, horse, and pigs. Family members listed on the 1855 census included Jacob Houck, his wife Adeline, his mother Catherine Ann, his brother Peter, his grandmother Marie Endern, and a female servant from England (Adelaide Smith). The little house attached to main house was likely intended for the mother and/or the grandmother of Jacob Houck. By 1868, family holdings appear to have extended along the road with one distant structure identified as J. Houck on the Map of Montgomery and Fulton Counties (Stranahan and Beach), along the treeline of the old SR 5S south of present-day #1711 SR 5S (outside of the PIN 2029.57.101 project area). Stone foundations were identified in an inspection of this area.
>
> In the 1875 agricultural record, the property value had increased from $13,500 to $22,600. Changes in production on the farm included an increase in the acreage being farmed, the addition of rye and flax in the crops, as well as cattle being raised for beef. The 1875 census

shows that two farm hands were hired to help with the work, and that Peter Houck was also involved in farming on his own, albeit with half of his acreage remaining wooded land. A drawing of the house in 1881 depicts the front yard with stone features and the orientation of surrounding structures, as well as a small bridge.

Records for the main house location become less detailed after this time. The brother's or tenant house on 4.67 acres at present-day #115 Hirschfeld Road was purchased in 1928 by the VanVechten family. A larger purchase of 240 acres was made by the Larrabein family in 1929, which likely included the main house. This same area was purchased by Harvey Reese in 1931, by Anthony Chaks and then by the Pawloski family in 1932, and by the Czeck family in 1933. Constantine Kuber purchased the 240 acres in 1935, the last time the larger lot is indicated.

From this point on, the property is listed at 8.37 acres in the Town of Florida, presumably the #115 Hirschfeld Road structure and immediately surrounding buildings. The property changed hands to the Yunkers in 1957, to Constance Hauer in 1974 and to the Bushman family in 1982, the present owners of the tenant house. The main farmhouse and surrounding barns are currently the property of Montgomery County Industrial Development Agency.

Further work in the form of a site evaluation…is recommended if the site cannot be avoided during construction.

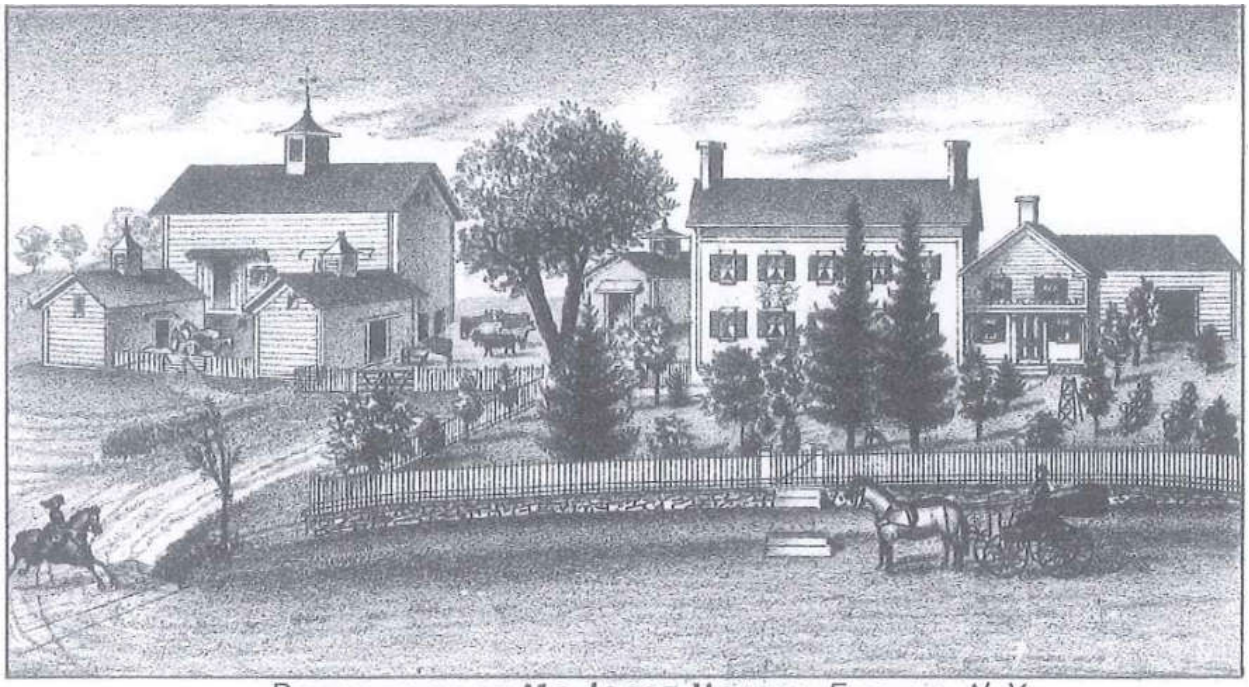

Figure 3. Illustration of the Houck farmstead published in 1878 (F. W. Beers & Co. 1878).

Figure 4. Photograph from the 2002 report showing the Houck farmhouse prior to its removal. View looking northeast (Hartgen Archeological Associates 2002).

Archeology conducted in the summer of 2002 for Lot 4 of the Town of Florida Business Park involved subsurface exploration of the Houck Farmstead and Cemetery. Forty hand-excavated shovel tests were placed in the site and plowed transects were placed to the north and south of the Houck cemetery. Three locations were stripped of topsoil in order to locate historic features: 1,600 square feet on the northwest side of the Jacob and Christina Houck farmhouse, 2,050 square feet east of the house, and 1,300 square feet at the Houck cemetery. The explorations near the farmhouse encountered former walkways and, northwest of the house, two historic sheet midden deposits. Disturbed soils associated with the former location of a swimming pool and of a summer kitchen were found in the eastern stripped area (Hartgen Archeological Associates 2003).

The exploration work at the Houck Cemetery documented the existence of corner fence posts surrounding the cemetery, three head- and foot-stone pairings (including Isaac Houck's), and a dog burial. Stripping confirmed the presence of a graveshaft at the Isaac Houck gravestones.

Another archeological survey for the Beech Nut Relocation Project was conducted in this area in 2008, and included the previously identified Houck Farmstead and Cemetery, which was determined by OPRHP to be a National Register Eligible site.

Artifacts collected from the site during the 2008 Beech Nut Relocation Project included ceramics (19th-century creamware, yellowware; hard-paste porcelain; redware, whiteware, and stoneware); a silver-plated spoon, food waste (faunal bone), ball clay white tobacco pipe fragments, vessel glass, rubber tires, construction material debris, and gravestones.

According to the 2008 report, Montgomery County had agreed to place decorative metal fencing around the Houck cemetery. "In order to protect the 5.2-acre Houck farmstead from ground-disturbing activity associated with the Beech-Nut Relocation project, the farmstead and cemetery have been placed in a conservation easement parcel. Therefore, the project will avoid the archeological site and cemetery" (Hartgen Archeological Associates 2008b).

2.2 J. Houck Historic Site (OPRHP 05704.000188)

The J. Houck Historic Site (OPRHP 05704.000188) is situated southwest of the Jacob and Christina Houck house, part of the Houck Farmstead and Cemetery (OPRHP A05704.000119 and A05704.000121) farther east on Route 5S as described above. The Houck's also owned an adjacent tenant house that they rented to a series of individuals. The J. Houck Historic Site property was originally shown on maps in 1853 and 1866 (Geil and Hunter 1853; Nichols 1868). Earlier maps do not indicate individual property owners. The site probably predates 1853, and was depicted on maps through 1905 (Century Map Company 1905). Analysis of subsequent historical maps reveals that the house was demolished between 1905 and 1931 (Century Map Company 1905; USGS 1931). The residence at the J. Houck site under study here also appears to have been a rental property, leased to tenant farmers who worked the land.

The J. Houck Historic Site was initially identified during Hartgen's Phase I Archeological Investigation of a 140-acre parcel of land that will be developed as part of the Winstanley Distribution Center project (Hartgen Archeological Associates 2019b). The Phase I and II archeological investigations were conducted by Hartgen in January of 2019 and March of 2019, with addendum Phase I investigations conducted in September of 2019 (Hartgen Archeological Associates 2019a, c). The investigations identified the J. Houck Historic Site, situated in the central portion of the Project within a wooded section of the APE. Historic maps of the area show the Houck property located just to the north of a roadway that has since been rerouted. Within the wood line was evidence of an old rock wall, with piles of cobbles visible in a line throughout this area. Two small streams, roughly parallel to one another, also ran through the wooded area alongside the rock wall. These were determined to be drainage ditches on either side of the former roadway. Some disturbance was noted throughout this area, though initially little evidence of the former roadway was visible on the surface.

This site consists of the remains of a single-residential structure and an associated well, located along the original route of State Highway 5S, which now runs to the north of the site. Three features were identified: a cut stone foundation/cellar hole (Feature 1), a house floor associated with an east and south side addition to the stone foundation (Feature 2), and a stone well (Feature 3) (Table 2). Phase I and II archeological investigations indicated a date of approximately 1820-1853 for the foundation/cellar hole and the well, and a post-1888 construction date for the east and south side additions to the original foundation.

The remains of the dwelling consist of a stone foundation with cellar hole, a collapsed brick fireplace back associated with a stone hearth built into the stone foundation and what appears to be an L-shaped addition along the east and south sides of the structure. The data suggested that the main portion of the residence was built between 1820 and 1853, when it is first shown on historic maps. The addition was built sometime after 1888 based on the date of a coin found just below the stone floor slabs. The well is stone lined and still contains water. Efforts to examine any contents were hampered by a post-occupational deposit of field cobbles filling up to a depth of about five feet below the ground surface. The property was owned by the locally important Houck family over several generations who used the site as a rental property. It was occupied by a series of tenants, many of whom worked as laborers for the Houck family.

Phase II field investigations established site boundaries based on drop-off of archeological materials during shovel testing. TPQ dates had a large range—from 1780 to 1920—suggesting long-term use of the site before and after residence was present. Some ambiguity remained about the form of the structure after excavation of the test units. Excavations suggested the visible foundation and cellar hole were the original structure dating between 1820 and 1853 when it appears on the Geil map. Stone walls and floor slabs suggest that the structure had at least one addition wrapping around the east and south sides added sometime after 1888.

Table 1. Summary of archeological site information collected during the Phase I and II studies

Characteristic	Site information	Source of information
OPRHP Site No.	05704.000188	
Site Name	J. Houck Historic Site	

Characteristic	Site information	Source of information
Description	Historic site consisting of a stone foundation and well. The artifacts collected in this vicinity included 3 strap hinges, likely barn door hinges dating to the mid-late 19th century, and two pieces of unidentified wire hardware surface collected near the foundation remains. In addition to the surface artifacts, nearby shovel tests contained cut nails, handmade amber bottle glass, manganese solarized and embossed pale aqua vessel glass, faunal bone, and a variety of ceramics including redware, yellowware, whiteware, salt-glazed Albany slip stoneware, molded ironstone and porcelain. The metal strap hinge, cut nails, salt-glazed Albany slip stoneware, molded ironstone, and handmade amber bottle glass can be approximately dated to the mid- to late-19th century, a time period consistent with the occupation of the house according to historic maps. A 1888 dated Indian head penny recovered immediately below a floor slab provides a TQP date for construction of an addition to the original house. Some earlier artifacts such as ball clay pipe fragments suggests use of the site prior to construction of the foundations under study. Two midden deposits, one from the 1920s and the other from the 1930s were created after the demolition of the residential structure. The structure appears on historic maps from 1853-1905.	Historic maps, documentary research, artifact analysis and stratigraphy
Date	~1830-1905	Historic maps and artifact analysis
Function	Residential	Artifact analysis and architectural form
Size	0.5 acre	
Location	NAD 83, UTM Zone 18, 562724 Easting, 4753742 Northing	

2.2.1 Site Stratigraphy and Chronology

Archeological excavations throughout the J. Houck Historic Site (outside of the foundation footprint) indicated that the site stratigraphy was reasonably uniform, with an A-horizon consisting of a dark gray silty loam to depths ranging between 20 and 55 centimeters below the ground surface. This was typically underlain by a B-horizon consisting of a yellowish or grayish brown clay silt mix. Soils were poorly drained owing to the clay in the B-horizon, particularly during excavations in early 2019. Phase III archeological investigations, which occurred in November and December of 2020, did not encounter the same poor drainage seen during earlier excavations.

The three units excavated within the original stone foundation footprint were fairly consistent to one another stratigraphically (Units 10, 16, and 17; Photo 2). After removal of the post-occupational deposit of large field cobbles, soils consisted of black silty loam with additional cobbles and post-occupational debris, underlain by a light brownish gray sand which appeared to be disintegrated mortar, and a third layer of yellowish-brown silty clay. Beneath this was a thin layer of very dark brown clay and disintegrating shale, underlain by the brown silty clay subsoil. The shale inclusions appeared to be natural, as large pieces of shale were noted in the subsoil as well.

Within the suspected addition, Units 2, 4 and 6 contained a man-made layer of floor slabs/cobbles that were likely placed on the existing surface at the time of construction which have since accumulated enough soil to be buried just below the present-day surface. Similarly, a layer of smaller cobbles was encountered in the first level of Unit 12, terminating at a soil transition at a depth of approximately 35 centimeters below the ground

surface. All cultural materials were recovered from the first 35 centimeters of Unit 12. This level was underlain by light olive brown silty loam subsoil; no cultural materials were recovered from the subsoil.

The initial indication of the date of the structure came from a sample of the collapsed bricks located along the west side of the structure whose attributes suggested a manufacturing date of around 1820 (between 1810 and 1830). However, the best archeological indications of the chronology for the features come from two artifacts with clear dates. Three refitted ironstone ceramic sherds featuring an embossed lily of the valley motif dating from the 1850s or 60s was recovered in Level 3 of Unit 3 alongside the west foundation wall in a context that suggests it was deposited in the construction trench when the foundation was built. The Geil map indicates that the main structure was present by 1853, suggesting this would be an early example of the style.

Feature 2, the floor in the structure's addition, was securely dated as having been constructed sometime after 1888 based on Phase II archeological investigations. This is the date on an Indian-head penny located immediately below a large floor slab in Unit 2, located just south of the foundation wall.

North of the foundation, Unit 14 was situated at what appears to have been the rear of the house. This unit did not indicate the presence of any further additions to the north.

The structure was still present at the time that the 1905 Century map was published and was demolished before the creation of the 1920s midden deposit in the cellar hole. Possibly not coincidentally. According to cemetery records, owners Adeline Houck, wife of Jacob Houck died in 1903 at the age of 70 and Jacob Houck died in 1905 at the age of 72 (Montgomery County History and Archives n.d.). It has been determined that the house was demolished between 1905 and 1931 (Century Map Company 1905; USGS 1931).

Mid- to late-19th century and early 20th-century artifacts were distributed throughout the site. Earlier materials included a buff/pink-bodied stoneware vessel manufactured by Nathaniel Hudson that dates c. 1852-1866, Prosser buttons (TPQ 1840), and a cast iron and brass Kenrick's Patent coffee mill and metal tag (c. early- to mid-19th century). Many artifacts recovered during Phase III archeological investigations at the J. Houck Historic Site dated to the late 19th century. This included a variety of ceramic materials, a 19th-century enameled metal teapot spout, late 19th-century sewing machine parts and children's toys, and a range of diagnostic vessel glass.

The site chronology appeared largely as expected within the original foundation footprint, with post-occupational artifact deposits at or near the surface within the foundation, and earlier materials recovered from the mortar layer and below the wooden floorboards. For example, Unit 16 contained four buttons, ball clay-white tobacco pipe stems, nails, painted and beaded whiteware, a fragment of a pewter pocketknife, faunal bone, a medicine bottle, additional green and amber container glass, clear window glass, and other materials beneath the mortar layer and suspected floorboards (Level 3).

Immediately south of the foundation near the suspected doorway, Unit 13 contained such diagnostic artifacts as shell-edged whiteware, which was popular between 1820 and 1860, and salt-glazed stoneware (c. 1705-1930, though likely mid- to late-19th century). Black underglaze transfer-printed ironstone was recovered from Level 3 of Unit 13. While ironstone was produced between 1842 and 1930, the transfer-printing technique was used from the mid- to late-19th century.

Cultural materials within the stripped area north, northwest, and west of the original foundation tended to date post-occupation, with a number of c. 1920s and 1930s artifacts catalogued from these proveniences. This is consistent with the chronology identified during earlier excavations, as mechanical stripping focused on removal of the overlying topsoil to search for features visible in the subsoil and did not go as deep as trenching or unit excavations.

A 1976 United States dime was recovered from the first level of Unit 11, situated 50 centimeters south of the well, indicating modern activity in this area. Subsequent levels contained historic cultural materials generally dating from the mid-19th through the early-20th centuries. These included olive vessel glass, cut nails, transfer printed and other decorated whiteware, Albany slip and salt-glazed stoneware, Nathaniel Hudson buff/pink bodied stoneware (c. 1852-1866), pharmaceutical bottles, an Illinois Glass Co. bottle with a TPQ of 1911, and

other historic cultural materials. Additional stoneware sherds matching the Nathaniel Hudson vessel were also recovered from Unit 10, within the original foundation footprint.

Mechanical excavations revealed that there were no significant archeological deposits within the stone well. Although there was no cultural evidence to definitively date this feature, it is likely that the well was contemporaneous with the original house footprint and was likely constructed c. 1810-1830.

2.2.2 Archeological Features

Three archeological features were identified during Phase I and II archeological investigations at the J. Houck Historic Site (Table 2).

Table 2. Summary of archeological features

Feature	Function	Date	Integrity	Artifact content
1	Foundation/cellar hole	c. 1820-1853	Good	Early 20th-century midden deposit
2	Floor (east and south side addition)	Post 1888	Good	Mix of typical domestic artifacts including ceramics, glass and faunal bone. Indian head penny dated 1888 was found immediately below floor slab in Unit 2.
3	Well	c. 1820-1853	Good	Undetermined

Feature 1 was a readily visible cut stone building foundation and cellar hole consisting of irregular, cut limestone blocks. It measures 15' 8" by 16' 8" feet at the outside corners and is 1' 8" thick. The interior surface has been dressed leaving an even flat wall. The exposed outer surface is irregular. A hearth or hearth support is set into the west wall extending like a shelf into the interior space. An adjacent concentration of bricks and mortar represents the collapsed chimney.

Because the bricks were associated with the hearth which appears to be original to the structure, the bricks themselves are good evidence for the initial construction date of the structure. Hartgen's architectural historian Walter R. Wheeler examined a sample of complete bricks from the collapse feature and determined that they likely date between 1810 and 1830 based on the dimensions, uniformity, and quality of firing. The excavated artifacts also provide some idea of the construction date since they are from the construction trench. If we assume that a "Musterole" bottle found near the surface is part of the post-occupation 1920s midden based on its 1926 TPQ, the oldest TPQ is in the 1850s from three fragments of refitting ironstone with a lily of the valley embossed motif (Hartgen Archeological Associates 2019c: 11).

Feature 2 was a floor for what appears to be a later L-shaped addition to the structure which runs the length of the east side of the foundation (Feature 1) and wraps around the south side of the structure. It was first encountered in Unit 2 where it consisted of a large flat slab extending south from the foundation (Map 2). The same flat slab construction was seen in Unit 6. Unit 4 also contains a floor whose outside edge runs along the same line at the floor in Unit 6. However, its construction differs, consisting of a level layer of rounded cobbles forming the outer line with more irregular stone fill inside. This may indicate that the two sections were built at different times or had a different function (i.e., one being an internal floor surface and the other an external patio space). It was unclear where one section ends and the other begins.

Feature 3 was a roughly 3-foot diameter well located approximately 40 feet northeast of the Feature 1 foundation and 30 feet northeast of the Feature 2 floor (Map 2). Attempts to collect a column sample of sediment and artifacts from the bottom failed because an obstruction was encountered. The well had been partially filled with the same cleared field cobbles found inside the main foundation up to a depth of about five feet below the surface.

2.2.3 Artifacts

The artifacts collected during Phase I and II archeological investigations are consistent with an occupation lasting from the early to mid-19th century until the early 20th. There are two distinct midden deposits on the site, one from the 1920s and the other from the 1930s that postdate the occupation phase. There is no

indication of disturbance of the site, suggesting that the site retains its integrity and has the potential to provide useful data. The artifact distribution is quite restricted with almost all recovered materials from both Phases I and II being restricted to a 33-meter (110 feet) radius around the structure's foundations.

The collection is a typical domestic assemblage including ceramics, glass and food remains. The ceramic materials contain a mix of types including salt glazed stoneware, redware, yellowware, whiteware, ironstone and porcelain. The vessel forms are dominated by serving wares although some storage items such as jugs and crocks are also present. Many of the glass artifacts collected are bottles, from food and beverages, as well as medicines/beauty products. There were also a significant number of glass serving wares in the collection. Construction materials such as nails, hardware and window glass were also well represented in the collection. The faunal assemblage contains many large mammal (cow and pig) bones with evidence of butchering and cooking. Interestingly, the elements that are present are generally not from the meatiest "best cuts" which may reflect lower socio-economic status of the occupants, who sources indicate were renting the property from the Houck family. Several commensal species, primarily rodents, were also recovered. Faunal analysis conducted on samples collected during Phase III archeological investigations are compared against data collected during Phase I and II archeological investigations.

3 Environment and History

3.1 Environmental Setting

The Project is situated in the Mohawk Valley, approximately 1.1 mile south of the Mohawk River. The Town of Florida is bounded by the Schoharie Creek on the west, and by the Mohawk River (Erie Canal) on the north. The City of Amsterdam, the only city in Montgomery County, is situated approximately 1.1-mile northeast of the Project. Historically, the Erie Canal, and the nearby Mohawk Turnpike and Utica and Schenectady Railroad were significant methods of transportation and were all running along the shores of the Mohawk River by 1835.

3.2 Regional Cultural Context

The remarkable aspect of the Houck family farm is the continuous occupation by the descendants for over 100 years. Probably the original European settlers on the parcel, the Houck brothers initially cleared and plowed the property, and their children and grandchildren reaped the rewards of a profitable farm for decades afterwards. Like many middle-class farmers of the time, the 200 acres of land were beyond the means of two adult males to farm by themselves. As a result, farmers choose different strategies over time, which included:

- enslavement of Africans,
- sharecropping with neighbors, extended family members, and others,
- rental agreements (for both cash and/or crops),
- and part-time and full-time wage laborers.

Such strategies, as we will see, were not mutually exclusive of each other. After gradual emancipation in 1825 in New York, various economic crashes and booms led landowners to adopt various means to leverage non-family labor for farm work. In part, these were dictated by the owner's access to capital, the number of family members available to share the work, the size of the farm, and the labor pool locally available.

Historical documents indicate that the Houck family kept slaves through at least 1820, as slaves were listed on the 1810 and 1820 census records (United States Census Bureau 1810, 1820). *The History of Montgomery County* noted that "when in 1824 the act of emancipation took effect, they gladly went from under the yoke, to establish homes of their own, and none but the hopelessly infirm or aged sought to remain with their late owners" (F. W. Beers & Co. 1878: 113). However, the Houck family continued to rely on labor provided by free African Americans long after that date. In 1830, Jacob Houck was between 50 and 60 years of age and lived with one woman of the same age, two young adult men, one boy, one young adult female, one girl, and one free African

American male between 10 and 23 years of age (United States Census Bureau 1830). Census records indicate that free African American laborer Benjamin Havens worked for the Houck family for over seventeen years, between 1875 and 1893.

We currently have no records of the Houck family to shed light on the agreements made with non-family members, therefore we can only speculate on the situation based on the larger historical context in which non-family laborers were associated with the Houck farm.

The 18th and early 19th centuries

Prior to the 18th century, the land east of the Schoharie Creek and south of the Mohawk River was part of the larger territory of the Mohawk tribe of the Iroquois. Their principal larger villages were primarily west of the Schoharie River. At the mouth of the Schoharie, English colonists constructed a small defensive fort known as Fort Hunter in 1712 to help protect their Mohawk allies from attacks by the French and their Native allies during Queen Anne's War. The English took advantage of the opportunity by also constructing a chapel to encourage converts to the Anglican faith and negotiated the settlement of Palatine German immigrants to the area as well in the hope of further bolstering protection from French depredations. However, in the immediate vicinity of the Project, it appears the initial settlers were primarily Scotch-Irish and older Dutch families. The fort and its related chapel stood until about 1820 when the Erie Canal was under initial construction.

In the late 1730s William Johnson emigrated from Ireland to oversee the estate of Captain Peter Warren, uncle to Johnson, who purchased the tracts from Charles Williams, the original patentee. The large landholding was variously referred to as Warren bush, Warrensboro, Warrenburgh, Warren's town and the like. During this time, Johnson settled six Irish immigrant families in the area, but not all the settlers stayed due to the continued threat of French attacks, especially during King George's War. Eventually, Johnson started his own large estate north of the Mohawk but continued to control and lease out much of the land within Warrensbush. The J. Houck Historic Site is situated at the very western end of the Warrenbush patent, while the larger Houck farm appears to occupy former Lots 146, 147, 152, and perhaps part of 153. According to the Taylor map of 1795, which surveyed the lots laid out in 1766, a farmhouse was located northeast of the current excavations in Lot 147-the Houck farmstead. The J. Houck Historic Site is located at the very southern end of the lot but was likely constructed in the 19th century.

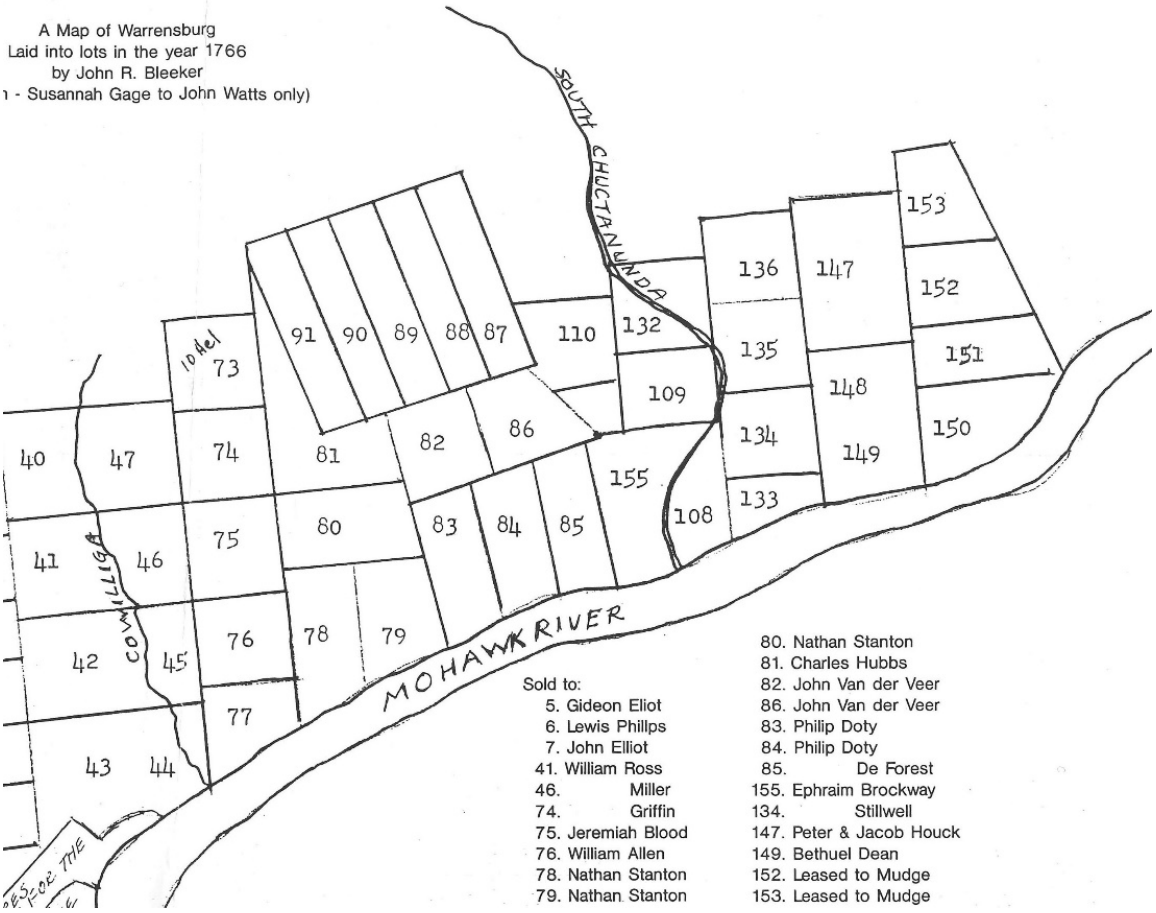

Figure 5. 1766 Bleeker *Map of Warrensburg Laid into lot in the year 1766* (Bleeker 1766).

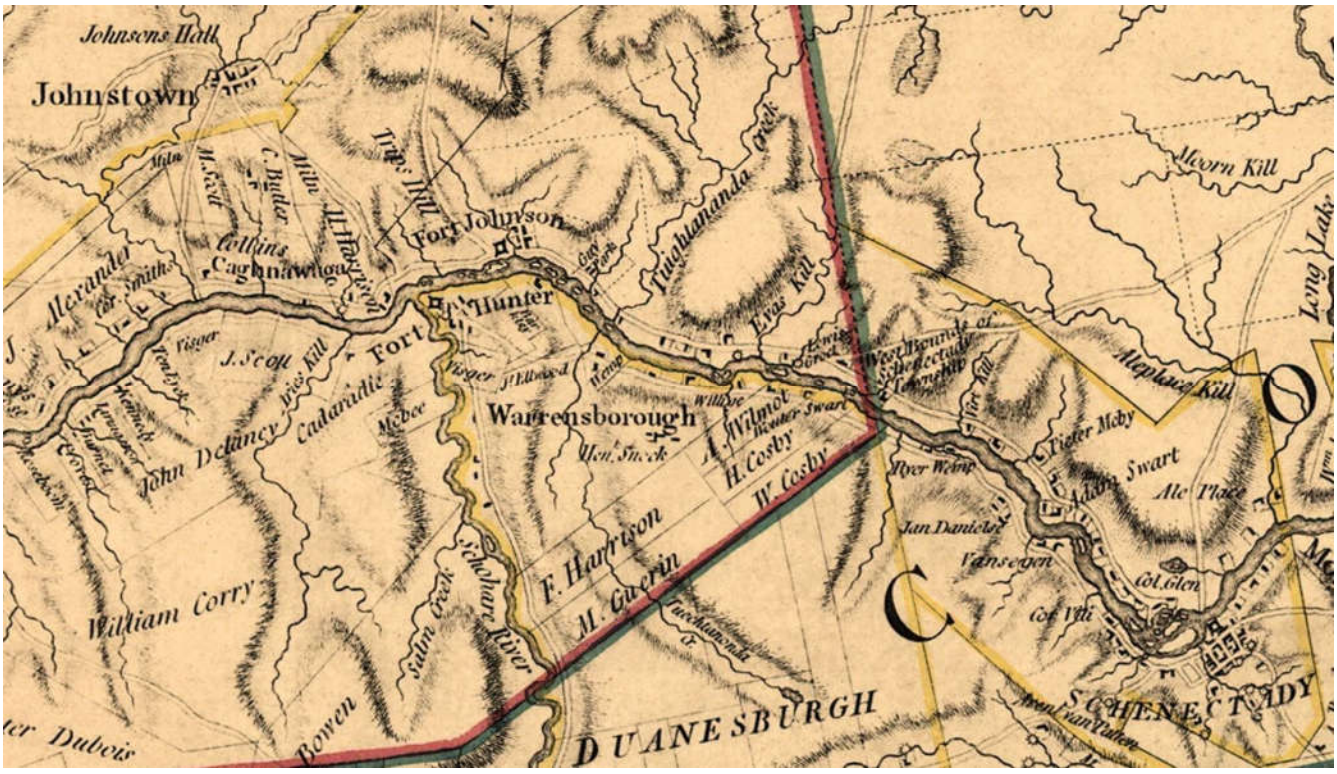

Figure 6. 1779 Sauthier *A Chorographical Map of the Province of New York in North America* (Sauthier 1779).

Figure 7. Houck House on 1766-1795 Warrenbush map. Underlay image courtesy of Google Earth. Note the tenant house is at the very southwest extent of the farm lot. The Houcks owned Lot 147 (lot numbers are upside down in this view).

By 1756 Johnson was appointed as Superintendent of Indian Affairs in New York. Over the next 30 years, Johnson made a remarkable impact on the area further advancing English interests and befriending and leveraging the assistance of the Mohawk Nation in colonial politics and warfare. Eventually Lots 82-86, the northeastern portion of the current Project, were sold to Henry Huff, and eventually many of the lots were purchased by John Watts, Jr. (Lampkin 2011). As an absentee landlord in New York City, both owner and tenants became disillusioned with the situation and by the end of the 18th century, Watts sold his holdings to the tenants on his land (Frothingham 1892:300). His interest in the area remained however, as his daughter Mary married Sir John Johnson, William's only son (Lampkin 2011).

As it relates to the Houck property, according to the 1793 deed, the farmstead was purchased by the family, but the surround farms were still leased to others, including Jeremiah Birch, Albert Franck, George Northman, and a small trio of framers known as "Mudge, Billing, and Truesdell."

During the Revolutionary War, the Johnsons helped to organize and recruit Mohawk raiding parties to attack farmers in the valley who joined the colonial cause. The Johnsons and the allied Mohawk Nation remained loyal to the crown throughout the war. It is likely, but not recorded, that the farms in the Warrensbush area were burned, destroyed, or otherwise abandoned until after hostilities ceased (Lampkin 2011). After the war the Johnsons fled to Canada, the Mohawks relocated northward, and many Loyalists properties were confiscated and sold. Despite his close ties with the Johnsons, Watt seems to have retained his property, but the situation likely proved perilous.

The Houck brothers, Peter and Jacob, appear to be some of the first renters of the larger Watts landholding to pursue purchase of their improved farmlands. It suggests that the family was able to raise substantial capital to make the payments, perhaps through family inheritance as evidenced in their grandfather's will of 1785.

3.3 Property/Family History

The Houck family were important in the settlement and early development of the community of Florida, New York. The Houck family had its roots in Holland and by the later 18th century amassed significant property in and around the Schoharie and Mohawk Valleys. Their grandfather, Hendrick Houck, lived in today's village of Esperance and farmed a rich plot of land along the creek since about 1729. His son, Peter Houck, apparently died at a relatively young age. As a result, much of the family's lands-holdings devolved to his still young sons and daughters, most of whom had yet to reach their majority. Two of the recipients of the Houck family largess were the brothers Peter and Jacob Houck. Jacob eventually settled on a farm in Florida by the early part of the 19th century.

The Town of Florida was formed from Mohawk on March 12, 1793, making the Houcks some of its earliest settlers. Peter and Jacob Houck were listed as recipients of "sundry lots" conveyed by John Watts in a document dated November 13, 1793 (F. W. Beers & Co. 1878: 111). The deed between Watts and the Houcks is dated 21 September 1793.

An 1801 New York Tax Assessment Rolls of Real and Personal Estates listed Jacob Houck with $2,690 real estate and $592 personal estate ($3,282 total), in addition to 5 dollars and 74 cents. The 1802 real estate and personal estate totals were the same, though Jacob Houck was listed with $4.10 in cash (Ancestry.com). Just a few years later, Jacob and Christina Houck's home was assessed as one of the most valuable properties in the Town of Florida in 1805 (Hartgen Archeological Associates 2008a).

Census records provide additional details such as who occupied the project area, their occupation, and where they were born. The following table lists the census date, head of household, and property occupants' ages, places of birth, and occupations from the 1810 Federal Census through the 1940 Federal Census.

Table 3. Population census records for the Jacob & Christina Houck House and the J. Houck Historic Site.

Census Date	Head of Household	Occupants	Listed Age	Place of Birth	$ Real Estate	$ Personal Estate	Occupation	Notes
1810 Federal	Jacob Houck	1 male	26-45	n/a	n/a	n/a	n/a

The first population record for Jacob Houck was in 1810 when he was between 25 and 45 years of age. At that time, he was living in the Jacob and Christina Houck House, just east of the J. Houck Historic site. He was listed in the population census as living with one woman of the same age, four children and two slaves (United States Census Bureau 1810). By 1820, the population record listed him as living with one woman, five children/young adults, two slaves (one adult male and one young adult female), and one free African American female under the age of fourteen (United States Census Bureau 1820). In 1830, Jacob Houck was between 50 and 60 years of age and lived with one woman of the same age, two young adult men, one boy, one young adult

female, one girl, and one free African American male between 10 and 23 years of age (United States Census Bureau 1830). According to cemetery records, Jacob Houck died in 1839 (Montgomery County History and Archives n.d.).

By 1840, the ownership of the Jacob and Christina Houck House was transferred to Jacob's son Isaac Houck. In the 1840 population census, Isaac Houck was listed as the head of the family between the age of 30 and 40. He lived with one female the same age, four boys, 1 young adult female, three girls, and one female between 50-60 years of age (United States Census Bureau 1840). Christina Houck, the wife of Jacob and the mother of Isaac died in 1847 according to cemetery records (Montgomery County History and Archives n.d.).

In 1850, Isaac Houck was recorded at age 47 and living with his wife, Catherine, 37. They had two sons, Jacob and Peter. The 64-year-old Maria Houck was living with them in this year (United States Census Bureau 1850b). Perhaps Maria Houck was Jacob's sister, but no documentation was found to support that assumption. In this year, Isaac Houck's farm was valued at $10,000 and he farmed 170 acres of land. His main crops were oats, rye, and corn. He had 9 horses, 4 milk cows, 9 beef cattle, 2 oxen, 34 sheep and 9 pigs. His livestock was valued at $718 (United States Census Bureau 1850a).

According to cemetery records, Isaac Houck died in 1850 (Montgomery County History and Archives n.d.). His son, Jacob, acquired the property of the Houck estate and was listed as the head of the household in the 1860 population census at the age of 27, living with his wife, Adeline. His brother, Peter, and his mother, Catherine, also resided with him. A 16-year-old African American boy named James Dennis, most likely a farm laborer, was also listed in the household. While young during his residence on the Houck property, Dennis later became a rather prominent member of the Town of Amsterdam.

Figure 8. Undated photograph of James Dennis in uniform, published in the *Amsterdam Evening Recorder*. The caption notes that "he is thought to be the only colored veteran in Montgomery county" (Montgomery County Historical Society).

Like the other tenants of the Houck farm, Dennis did not remain an occupant of the property for long. He was not recorded among the inhabitants of the Houck property on the 1870 census. *The Albany Journal* reported on February 20 of 1888 that "James Dennis, of Amsterdam, has been appointed janitor of the comptroller's office at Albany" (Montgomery County Historical Society). He later returned to Amsterdam, and his death was recorded in the *Amsterdam Evening Recorder* on December 18, 1914. He was described as "man of lowly station and black skin" with a "true heart," who "performed humble tasks for a living" and "never possessed much of this world's goods." The newspaper recorded that he "fought bravely for the Union during the Civil war," and "was a well-known member of the Grand Army of the Republic." He was official bearer of the flag at state encampments and carried the flag in Memorial Day processions in Amsterdam as a member of E. S. Young Post, 33, Grand Army of the Republic. The paper also noted that "everybody had a friendly word for 'Jim' Dennis. He had proved himself a man. In him were the essential qualities of the best American citizenship" (Montgomery County Department of History & Archives).

The 1860 population census record suggests that African American John Miller and his wife Jane were living in the house at the J. Houck Historic Site. It is believed that John Miller who was listed as a farm laborer in the population census living directly adjacent positioned west of the Jacob and Christina Houck House, was

working for Jacob Houck and living in this house on the Houck estate (United States Census Bureau 1860b). According to the 1860 agricultural census, the amount of land farmed increased to 264 acres, and the value of the farm increased to $16,000. The main crops this year were oats and corn. The value of livestock increased to $1,400 which included 8 horses, 5 milk cows, 20 beef cattle, 4 oxen, 45 sheep, and 5 pigs. John Miller was not listed in the agricultural census of this year; only landowners appear to have been recorded at this time (United States Census Bureau 1860a).

By 1870, James Dennis no longer lived at the Houck's main house but Jane Miller, a four-year-old girl, lived with the family. It is believed that this child was a relation to John and Jane Miller who lived next door in 1860 (most likely the daughter of Jane Miller). John and Jane Miller were listed as living in a different area of the town of Florida according to the population census for that year. Historical records show that John Miller acquired property in Amsterdam sometime after his move from the Houcks', which was described as "Lot 20 N.W. ¼ 40 [acres?] in Township 12, Old Military Tract" (Montgomery County Historian). Jane Miller passed away after 1860. On January 8, 1874, John Miller married Maria Miller of Canajoharie, and the couple relocated to that community, where they resided until John's death in 1887 at the age of 90.

The 1870 census records imply that farmer, Loronzo Lisdell rented land from Jacob Houck as well as the house which stood at the J. Houck Historic Site. He was 23 years old in 1870 and lived with his young wife, Anna and their daughter, Minnie. He is not recorded as owning any real estate in the population census but had $100 in his personal estate. There is another young farmer who lived directly next door. 25-year-old Jay Burt.

It is probable that Burt lived in what is known as the Houck Tenant Farmhouse which was situated directly east of the Jacob and Christina Houck House. Jay Burt lived with his young wife, Lydia and their 2-year-old daughter, Amy (United States Census Bureau 1870b). Neither Loronzo Lisdell nor Jay Burt were listed in the 1870 agricultural census because they were not property owners. According to the agricultural census of this year, the Houck farm decreased in size to 180 acres, but maintained the same value, most likely because Houck was renting out approximately 85 acres of farmland. The main crop continued to be oats, with an increase of their wheat crop. The farm was still heavy with livestock as they maintained 10 horses, 6 milk cows, 6 beef cattle, 2 working oxen, 23 sheep, 3 pigs, and 210 chickens (United States Census Bureau 1870a).

Jennie Miller who was listed in the 1860 population census living with the Houck family was in fact Peter Houck's daughter according to a later enumeration (New York State Census Bureau 1875). By 1880, Peter and Jennie did not live at the Jacob and Christina Houck House. In this year, Jacob Houck and his wife, Adeline continued to live in the main house with Jacob's mother, Catherine. They had a female servant from Prussia living with them and two male farm laborers. It is believed that the two males were living in the tenant farmhouse. Living directly next door to Jacob Houck was farmer, Timothy Fero and his family.

It is very probable that the Fero family lived in the house which used to stand at the J. Houck Historic Site. In 1880, Timothy Fero was listed at age 44 and his wife, Dorcas, was recorded as age 48. The couple had two teenage children (United States Census Bureau 1880b). According to the 1880 agricultural census, Timothy Fero was renting 85 acres of farmland in that year. It is believed that Fero was renting farmland from Jacob Houck while living at the J. Houck Historic Site. The 1880 census was the first time that the enumerators recorded whether a farmer was the owner or renter.

Jacob Houck's farm increased in value between 1870 and 1880 by $6,000. His main crop was still oats, but he did increase his buckwheat and corn crop. His wheat crop diminished from 200 bushels down to 18 bushels in that year. Houck had 6 horses, 5 milk cows, 7 beef cattle, 2 working oxen, 30 sheep, 5 pigs, and 120 chickens. Recorded immediately adjacent to Jacob Houck, was Timothy Fero in the 1880 agricultural census. Fero rented 86 acres of farmland from Houck in that year and his farm was valued at $9,000. His main crop was also oats, with his next largest crop being corn. He had 2 horses, 6 milk cows, 9 beef cattle, and 12 chickens. There are no later agricultural censuses available after 1880 (United States Census Bureau 1880a).

According to the 1892 state census, Jacob Houck and his wife Adeline were both 60 years old in that year, and his mother Catherine was 81. They had a seventeen-year-old female servant living with them, and an eighteen-year-old male laborer possibly living in the tenant farmhouse. It is believed that African American Benjamin

Havens and his wife Grace Havens lived at the house at the J. Houck Historic site in this year. The state census does not distinguish between households as the federal census does, so it is unclear if they lived in a separate house from the Houck family (New York State Census Bureau 1892).

Catherine Houck died in 1898 reported by the New York State Death Index (Ancestry.com 2019). In 1900, Jacob and Adeline Houck continued to occupy the Jacob and Christina Houck House. Living with them in this year was a young female servant and a young male farm laborer. Recorded living next door in the population census was John and Kate Miller. John Miller was listed as a 32-year-old farm laborer who rented out the house which he occupied. It is supposed that he and his wife were living in the Houck Tenant Farmhouse at this time. William Sanders and his family were recorded living next to the Miller's. William Sanders was documented as a 40-year-old farmer who rented out a house. Living with him was his wife, Amelia, and their four sons. It is believed that the Sanders family rented out the house which used to be located on the J. Houck Historic Site.

According to cemetery records, Adeline Houck, wife of Jacob Houck died in 1903 at the age of 70 and Jacob Houck died in 1905 at the age of 72 (Montgomery County History and Archives n.d.). John P. Van Vechten purchased the farm after the Houcks in 1903 and held the property through 1929. However, he doesn't appear to have lived on the property. The census records from 1905 through 1920 record him as living in Esperance during those years. He may have continued to rent the tenant house at the J. Houck Historic Site, as was the trend with many other landlords around this time, which would account for much of the later refuse recovered from the site. After the analysis of historical maps, it has been determined that the house which used to be situated at the J. Houck Historic site was demolished between 1905 and 1931 (Century Map Company 1905; USGS 1931).

3.3.1 The Houck Farmhouse

The main house is thought to have been constructed c. 1804 and was occupied until c. 2005. It was owned by Jacob and Catherine Houck and heirs from c. 1793 to 1878; and by Constantine Kuber from 1935 to 1957. The main farmhouse was dismantled c. 2005, and all other buildings were demolished around that time.

The NRE Jacob and Christina Houck House was one of the largest and most costly in the town. The home was accompanied by a small family cemetery. This Jacob, the grandfather of our "J. Houck," moved from Schoharie to the Town of Florida in 1793 and served in several official positions in the community (Frothingham 1892). Jacob, the grandson, was born in Florida in 1832 and inherited the property from his father Isaac upon his death in 1850. Jacob's brother, Peter, who spent many years living at the Jacob and Christina House, served as a First Lieutenant in New York's 153rd Infantry Regiment during the Civil War. Interestingly, according to Town Meeting Minutes from the Town of Florida historical records, Jacob Houck had a substitute for him to go into the Civil War in 1865 (W. Langworth).

Florida Town Meeting minutes revealed several other insights into Jacob Houck's community involvement. Houck was recorded as a "path master"/overseer of highways for District 2 in the Town of Florida. Houck also contributed to a "dog fund," although it is unclear what exactly this refers to. Later records also indicate that Houck claimed and/or was compensated for sheep damage.

3.3.2 Tenant Structures

Several generations of Houcks owned and occupied the house while providing two additional structures to tenant farmers. The J. Houck Historic Site was one of these rental properties. Examination of ceramics, food remains, and other material found at this this site offers to the opportunity to explore comparisons and contrasts between life in the main house and life as a Houck tenant and laborer, specifically the chance to examine issues of economic production and consumption as well as social status and how it related to ethnicity. The existence of documentary sources, such as a series of agricultural censuses listing specific details about these farm properties, allows an even more detailed and holistic analysis of these questions.

The following table summarizes the known (or suspected) identities of the tenants renting either the Houck Tenant Farmhouse adjacent to the main house or the J. Houck Historic Site home that is the focus of this study between 1860 and 1900. Due to the timing of censuses, it is likely that additional renters were present in the two properties which were not recorded.

Table 4. Summary of occupation of the J. Houck Historic Site

First Name	Last Name	Residence	Age	Census year	Occupation	Note
John	Miller	J. Houck Historic Site	45	1860	Farm laborer	African American
Jane	Miller	J. Houck Historic Site	45	1860		African American
Loronzo	Lisdell	J. Houck Historic Site	23	1870	Farmer	
Anna	Lisdell	J. Houck Historic Site	19	1870	Keeping house	
Minnie	Lisdell	J. Houck Historic Site	2	1870		
Jay	Burt	Houck Tenant Farmhouse	25	1870	Farmer	
Lydia	Loranzo	Houck Tenant Farmhouse	19	1870	Keeping house	
Amy	Burt	Houck Tenant Farmhouse	2	1870		
Benjamin	Haven	Houck Tenant Farmhouse	27	1880	Laborer	Presumably the same as the Benjamin "Havens" identified as an African American laborer in the 1892 census
John	Bickford	Houck Tenant Farmhouse	18	1880	Laborer	
Timothy	Fero	J. Houck Historic Site	44	1880	Farmer	
Dorcas	Fero	J. Houck Historic Site	48	1880	Keeping house	
Frank	Fero	J. Houck Historic Site	14	1880	At home	
Josephine	Fero	J. Houck Historic Site	12	1880	At home	
James	Dence	Houck Tenant Farmhouse	19	1892	Laborer	
Benjamin	Havens	J. Houck Historic Site	41	1892	Laborer	African American
Grace	Havens	J. Houck Historic Site	31	1892	Dress maker	African American
John	Miller	Houck Tenant Farmhouse	32	1900	Farm laborer	
Kate	Miller	Houck Tennant Farmhouse	30	1900		
William	Sanders	J. Houck Historic Site	40	1900	Farmer	
Amelia	Sanders	J. Houck Historic Site	39	1900		
Howard	Sanders	J. Houck Historic Site	14	1900	Farm Laborer	
Seymore	Sanders	J. Houck Historic Site	12	1900	At school	
Morris	Sanders	J. Houck Historic Site	9	1900	At school	
Erving	Sanders	J. Houck Historic Site	2	1900		

The J. Houck Historic Site housed a series of tenant farmers beginning prior to 1860 and continuing through at least 1900. Those recorded on available census records are marked in gray in the table above. Additional tenant farmers resided to the north near the main farmhouse, in what is referred to as the Houck Tenant Farmhouse.

3.3.3 The Houck Farm in the 19th century

The last will and testament of Jacob Houck provides some additional insight into the family's dynamics and possessions. Upon his death in 1839, Jacob Houck bequeathed "all my furniture in the dwelling house where I reside including silver plate" to his wife Christina, in addition to stoves, beds, and bedding, and "all the cattle and sheep" owned upon his death. Christina was also provided with "the use and occupation of the east half of the two story part of my dwelling house." Their son Isaac was tasked with providing for his mother and was bequeathed $2,000 and a horse of his choosing. Isaac's brother Jacob was to receive a horse of his choosing as well. Isaac was to receive "all the real estate, lands, and tenements belonging to me and situated in the town of Florida, Montgomery County, except about eighteen acres of land herein after described and which has for some years been in possession of Samuel Greenman Esq." Isaac also received "all my farming utensils, one pleasure sleigh and the pleasure two horse carriage, also all my horses not herein otherwise disposed of also my klock." Jacob and Christina's daughter Catherine received "two cows, and three two years old cattle and a mare

colt to be two or three years old." The plot of land possessed by Samuel Greenman, described as "north of lands belonging to me, east by the George Servoss farm, south by the highway and west by Samuel Greenmans land" was allotted to Isaac and Jacob. The family must have been financially comfortable, as both Isaac and his brother Jacob received plots of land in the Town of Glen, outside of the bounds of the Houck farm. Isaac and his sister Catherine also received sums of $2,000 and $1,500 respectively, while their sister Christina received $2,000 (Houck 1839).

It appears that Isaac Houck was elsewhere in 1855, but Jacob occupied the old family farmstead with his wife Adaline, his mother Catherine, younger brother Peter, his aged grandmother-in-law Maria Enders, and an English servant woman named Adelaide Smith. A decade later, the house was still fairly full. The grandmother passed away, but Jacob's brother remained and there were also two laborers in the house, James Hare (a local teenaged boy), and Shereson Flagg, a young German immigrant. The 1892 census still showed Jacob, Adaline, and Catherine (now 81 years old) living together with a female servant and a young female servant and male hired laborer.

The Houck family expanded the development of the property in the years following Jacob Houck Sr.'s death. Available agricultural census records indicate that farming operations gradually expanded between 1850 and 1880 under the supervision of Isaac Houck and his brother Jacob, with the farm valued at $22,600 in 1880. This is equivalent to a value of $640,575 today. The 1855 agricultural census lists a variety of goods including hay, grass seed, winter wheat, oats, barley, buckwheat, corn, potatoes, and apples. Animals raised on the farm included sheep, cows, horses, and pigs.

By 1868, family holdings appear to have extended along the road with one distant structure identified as J. Houck on the Map of Montgomery and Fulton Counties (Nichols 1868). This structure is the subject of the current archeological study. Archeological investigations suggest the structure was built earlier than this date although it does not appear on maps until this time.

By 1875, the farm's value had increased from $13,500 to $22,600, with more acreage being farmed. Agricultural census records indicate the addition of rye and flax into the crops, as well as cattle being raised for beef. Unlike many other farms throughout New York at time, the Houck family were able to maintain a diverse crop and livestock portfolio. Two farm hands had also been hired by this time, one of whom was likely Benjamin Havens. Havens was first recorded as a farm laborer for the Houcks in the 1875 New York State Census.

Table 5. Agricultural census records for the Jacob and Christina Houck House and the J. Houck Historic Site.

Year	**1850**	**1860**	**1870**	**1880**	**1880**
Landowner/Tenant	**Isaac Houck**	**Jacob Houck**	**Jacob Houck**	**Jacob Houck**	**Timothy Fero**
Acres of improved land	170	264	180	170	86
Acres of unimproved land	80		40	40	5
$ of Farm	10,000	16,000	16,000	22,600	9,000
$ Machinery	150	300	550	1,200	150
Horses	9	8	10	6	2

Hay (tons of)	80	5	30	150	50
Beeswax & Hones (lbs)					
$ Home-made manufactures		8			
$ animals slaughtered	30	50	90		
Flaxseed (bushels)		50		72	50

There was little expansion to the farm between 1860 and 1870 and, in fact, agricultural census records indicate a reduction in the acreage of improved land between these dates. One factor impacting the Houcks was the enlargement of the Erie Canal. According to "AN ACT for the relief of Jacob Houck, Peter Houck and Catharine Ann Houck" passed March 26, 1861, a portion of the canal expansion was constructed through the Houck farm. Jacob Houck was drafted for the Civil War in 1863 at the age of 31 but had a substitute go in his place, in 1865 (W. Langworth).

Between 1850 and 1880, the Houck farm maintained between 4 and 6 milk cows and produced anywhere between 800 pounds of cheese in 1850, to 400 pounds of cheese in 1870. The Houck farm maintained a variety of livestock including horses, milk cows, other cattle, working oxen, sheep, swine, and, after 1860, poultry. The Houck farm appears to have maintained a small orchard as well, with orchard products valued between $20 in 1850, and $90 in 1880.

Landowner Jacob Houck and tenant farmer Timothy Fero are listed individually in the 1880 agricultural census. This indicates that the J. Houck Historic Site maintained its own animals in addition to the Houck's main farm. In 1880, the agricultural census lists 2 horses, 6 milk cows, 9 other cattle, and 12 poultry for the J. Houck Historic Site. No mules or asses, working oxen, sheep, or swine were listed under the supervision of Timothy Fero.

3.4 Tenant Farming

The Houcks maintained a general family farm throughout the 19th century and, likely because of the richness of the land, did not invest heavily in the production of hops or in dairying. Farmers who did needed access to capital for start-up costs and labor to maintain, harvest, and process these products. The diversified nature of the Houck farm helped to ensure long-term financial stability of the business. It seems probable that the Houcks resisted hiring laborers in order to maintain capital and instead relied on rental agreements that incorporated sharecropping to assist with land management of the 200-acre farm. These agreements further helped the Houck family manage risk and provided a modest but consistent means to maximize the production of the farmland without cash outlays. The Houcks made a modest investment in constructing two houses and possibly additional outbuildings on the farm, but leases, rent, and sharecropping likely required additional initial investment by the family.

Tenants and sharecroppers could find these agreements advantageous or exploitive, depending on the terms. As will be discussed, the Houcks appear to have provided an advantageous situation for both tenants and wage laborers on the farm. Benjamin Havens worked on the farm for at least 17 years. At least two separate dwellings were provided for tenants, and both laborers and servants lived in the main Houck house. While not an entirely

equitable situation, the Houcks provided their laborers with several different incentives to commit to long-term work on the farm.

Tenant farming is defined as agricultural production of lands by individuals (or groups of individuals) who do not own or possess the property. While some may rent the lands for cash, more typically tenants famers paid with "a portion of the agricultural output" as agreed upon between the parties. After the end of slavery in New York, landowners typically also provided housing or accommodation for the tenant farmers, as by default they became residents on the farm for a negotiated term (usually 1-3 years). Some owners would also provide equipment and even start-up cash for seeds and loan other necessary items. Tenants also likely were provided land for their own animals and for use in raising goods.

Sharecropping was similar, but virtually all the seed and equipment were provided by the landowner. As a result, virtually all the products grown were to be returned to the landowner. The distinction is slight, but middle-class landowners, like the Houcks, likely retained tenant farmers as they did not have the means to furnish all the materials up front. Further, the Houcks lacked the means to hire many laborers to farm all the 200 acres. As a result, they were likely happy with the modest income they could raise on idle land utilized by tenants. By the start of the 20th century 35% of all farmers in the state were hired laborers (Parkerson 2005:1544). But throughout the 19th century, tenant farmers were critically important to the overall agricultural economy, especially for more modestly sized farms.

Farm tenancy must also be viewed against the larger economic trends of New York State. In 1837 and again in 1857, severe economic downturns crippled many land-owning farmers, and those with outstanding debts often lost their property when mortgages and loans were called in. As result, through the 1840s and early to late 1860s (and again in the post-Civil War period from 1870-1890), there was a relatively large, unlanded labor force agreeable to tenant farming. In fact, some researchers believe that tenant farmers viewed the arrangement favorably and as "mutually beneficial" (Summerhill 1995:130).

Despite the economic headwinds, New York enjoyed its zenith in agricultural production between 1850 and 1870, often leading the nation in terms of overall agricultural output (Gates 1969:116). In part, this was due to the success of scientific farming practices, advances in equipment and technology, better transportation networks, and a strong labor force.

After the war, New York farmers were at the mercy of larger Midwest and western farms that could produce large amounts of wheat and other grains relatively cheaply. New Yorkers were forced to change and adapt. Many converted to the dairy industry which provided greater cash returns and the declining need for tenants and sharecroppers. Those farms that remained committed to grains and similar crops (like the Houcks) quickly exhausted the productivity of the farmland as crop rotation necessary for long-term sustainability were abandoned to keep pace with rising costs and declining sales (Gates 1969:134-137). Census records reveal the out-migration of farmers and the abandonment of farms starting in the 1880s and accelerating in about 1910 (Hoglund 1953:187). This appears to correspond with the decline of tenant farmers on the Houck property. Despite investment to enlarge and perhaps modernize the tenant houses, farm laborers needed a wage to economically survive. The modest land-owning farmer could not afford such a cash outlay, paling their farm and lively on the brink. The fact that Benjamin Havens' wife (Grace) was involved with tailoring, points to the precarious situation of both the tenant farmer and landowner, as both needed cash to surviving the quickly evolving economy of the late 19th century.

Despite the updates to the tenant house and likely better terms for working the land, tenancy was no longer economically viable at the end of the century in New York State. Like many farms, the old tenant house quickly fell into disuse, disrepair, and eventually collapsed.

3.5 Local 19th-Century Farmstead Models

The rich farmlands of Warrensburg (today's Florida) were prized assets during the 18th and 19th centuries. A review of some nearby farmsteads with a constellation of outbuildings that survived into the modern era is worth exploring to provide some context for the Houck farmstead.

The Schenck homestead (90NR01534) situated along present-day Route 5 in Palatine, New York, which was later sold to Montgomery County and became the Montgomery County Poor Farm and cemetery, and the Daniel G. Van Wie Farmstead (10NR06181) at 269 Brower Road, Palatine Bridge, New York, which includes a house constructed prior to 1853, a c. 1874 barn, and several additional agricultural outbuildings are good models for the Houck farmstead.

The Schenck mansion was a two-story brick masonry structure with a large brick-floored cellar and a large attic. Two northerly wings were described, one a two-story brick wing and the other constructed of wood. The c. 1870 two-story Italianate style Van Wie Farmstead house was constructed of clapboard with a wood frame and interlocking joints. The large Dutch clapboard barn was constructed with a wood frame with interlocking joints and resided roof. It contained a stable wing added in the 1920s, and two attached silos. One barn was built prior to 1853 by A. Van Wie (1826-1891). A second barn was constructed in 1874 by George VanWie. In addition to the well-preserved contributing structures, the property is significant due to its association with historic hop production and dairy farming in the region. The hop house remained extant as late as 1979 and contained its original slotted floor and some original cloth.

The Samuel and Johanna Jones Farm (92NR00383), situated along NY-67 west of the junction with NY-296, is another such 19th century farm. The "Jones Farm," as it is locally known, consists of a Greek Revival residence on a typical mid-19th century farmscape belonging to one of the earliest farming families in eastern Montgomery County. This c. 1840s farmstead consisted of the main house with a limestone foundation with weatherboard walls, a wood shingle and metal standing seam roof, and limestone steps, in addition to five contributing structures historically associated with the residence. These include a c. late 19th-early 20th century cow barn, a milkshed, a privy, a machine shed, and a chicken coop. At the time the National Register forms were completed, the house maintained several original features including hand grained marbleized fireplace mantle in the living room, some original woodgraining on doors and windows dated 1878, original working exterior blinds, much original rolled glass, the original stone slab floor in the basement, and the original laid up stone dug well.

Like the Houck family, the Jones family remained on their property over several generations. Five generations of Joneses resided on the farmstead. The Jones farmstead was located within a few miles of four major transportation systems that may also have been used by the Houck family. These included the Erie Canal, the Mohawk Turnpike, and the Utica and Schenectady Railroad, which were all running along the shores of the Mohawk River by 1835.

The Town of Florida was formed from Mohawk on March 12, 1793. After the Civil War, many New York farmsteads were roiled by declining prices on produce. Many turned to dairy farming, but this required a larger farm and investment in large dairy barns (Summerhill 2008). *The History of Montgomery County* noted that the town was "mainly agricultural" around 1878 and was "well adapted to a varied range of products, well able to keep pace with varying markets." Initially, wheat was the town's staple crop, succeeded by barley and eventually oats and other cereals. The publication also noted that "a good deal of fine fruit [was] also yearly produced for market, and home consumption" (F. W. Beers & Co. 1878: 108).

There was also a distinct rise in the number of tenant farms through the end of the 19th century. Throughout New York, merchants were purchasing struggling farms in outlying towns and leasing the land to tenant farmers (Summerhill 2008). However, farms in this region such as the Houck farm and Jones farm appeared to be successful and remained in the families for generations. The Houck farmstead relied on labor from tenant farmers between at least 1860 and 1900, according to available census records. Expansion to the tenant farmhouse at the J. Houck Historic Site indicates that, even with an additional tenant house near the main farmhouse, more space was needed for the tenant farmers on the property and resources were available to provide a more comfortable living space for these workers. There is evidence, however, that these practices may have occurred on the farm at the beginning of the 20th century. John P. Van Vechten acquired the farm from the Houcks in 1903 and held the property through 1929. However, it appears that he never lived on the property. The census records from 1905 through 1920 record him as living in Esperance during those years. He may have continued to rent the tenant house at the J. Houck Historic Site, as was the trend with many other landlords around this time.

The nearby properties belonging to the McClumpha family investigated by Ed Curtin (Curtin 2001, 2003) were contemporary farmstead sites to the J. Houck Historic Site and the Houck Farmstead and Cemetery. The two sites, designated the J. McClumpha Historic Archaeological Site (05704.000115) and the W. McClumpha Historic Archaeological Site (05704.000116), were associated with extant farms and outbuildings. Ceramic assemblages recovered from the two sites during Phase I archeological investigations indicated that they may date as early as the mid- to late-18th century.

Phase II archeological investigations indicated that the J. McClumpha Historic Archaeological Site (05704.000115), situated 2,350 feet northwest of the J. Houck Historic Site, was a pre-1853 historic site consisting of an 1893 Chicago exposition medallion, whiteware, pearlware, flow blue, yellowware, spongeware, lusterware, gray salt-glazed stoneware, hand-painted polychrome pearlware, creamware, slip decorated buff earthenware, hand wrought nails, vessel and window glass, metal figurine fragments, and porcelain doll fragments. The area in front of the house contained stratified deposits and 18th-century contexts, while the other areas around the house contained scattered mid- to late-19th and 20th century artifacts in mixed contexts.

The associated W. McClumpha Historic Archaeological Site (05704.000116), situated 1,910 feet northeast of the J. Houck Historic Site, was a pre-1853 historic site consisting of whiteware, semi-porcelain, pearlware, black-glazed redware, flow blue, yellowware, gray salt-glazed stoneware, hand-painted polychrome pearlware, creamware, vessel and window glass, and cut and wire nails. One area of the site contained a light density of late-19th and early 20th century artifacts associated with farm outbuildings. In another area, a rock feature with early 19th century artifacts was identified.

Both McClumpha sites produced several polychrome pearlware and transfer printed whiteware pieces with identical decorative patterns and/or vessel shapes, indicating they may have been acquired at the same time from a common source, or handed down to different family members.

The 2002 NYSDOT-sponsored archeological survey conducted by Hartgen Archeological Associates also identified the Keller/Walrath Farm, situated west of the J. Houck Historic Site (Hartgen Archeological Associates 2002). This farmstead consisted of an intact farmhouse at 1797 State Route 5S, a barn at 1803 State Route 5S, and a tenant farmhouse at 1767 State Route 5S, where a section of the old State Route 5S intersects with the new State Route 5S. Historical maps indicate that the map-documented structures for the main farmhouse and tenant house date to about 1853. These structures were demolished sometime after 2002 for the construction of the Alpin Haus company. Shovel tests in the vicinity of the tenant farmhouse produced a small assemblage of artifacts including faunal bone, sherds of redware, creamware, and whiteware, unidentified iron, vessel glass, a nut and bolt, and fragments of brick and mortar.

By 1875, the Josiah Walrath farm consisted of 159 acres and produced hay, wheat, oats, buckwheat, corn, potatoes, and peas, with apple and pear trees producing fruit and cider. Like other farms throughout the state, the Walrath farm also relied on tenant farmers as well as dairy production toward the end of the 19th century. The farm had 27 cows producing 600 pounds of butter and 10,000 pounds of cheese in 1874. Like the Houck family, Josiah and his wife Caroline resided with their two sons, a hired hand, and a domestic servant in 1865. However, it appeared that the Walrath sons worked the farm by 1874, as no hired hands are listed at this time.

According to an 1878 record, the portion of the property near the tenant farmhouse may have also housed one of the only stores in the region in the early 19th century, and the main farmhouse had been used as a tavern in the early 19th century (F. W. Beers & Co. 1878).

4 Phase III Data Recovery Field Research Objectives

The J. Houck Historic Site possesses data relevant to the historical development of the region. It has the potential to yield important information relating to household economics; it offers an opportunity to reconstruct patterns of tenant household production and consumption. These patterns can be compared to those for the main, higher status, Houck property and other contemporary farmstead sites such as the nearby property belonging to the McClumpha family that was investigated by Ed Curtin (Curtin 2001, 2003), thereby providing a wider regional perspective. Additionally, as many of the documented tenants were African

Americans, it can provide data useful in examining social organization of rural communities in the mid to late 19th century; in particular, questions relating to household status and ethnicity.

The following research objectives were identified upon completion of Phase II archeological investigations.

The J. Houck Historic Site has the potential to answer a wide range of research questions. These include the following:

- Phase II investigations suggested that the residential structure was expanded decades after the initial construction of the stone foundations and cellar. Can a more detailed construction history and chronology of the residential structure and its possible additions be reconstructed? Are any activity areas evident from the remains of the structure?

- Unit 1 from our Phase II study was terminated after it filled with ground water and did not reach the floor of the cellar. Can the floor be exposed and activity areas defined with the watertable lowered through the excavation of a sump?
- Previous work did not reveal the location of a privy, a common feature of 19th-century houses which often provides significant preserved remains that can shed light on a variety of issues. Can a privy or other important features, such as middens, be located?

- If so, can study of the night soils give us data on the health and diet of the home's residents? Can their remains help us reconstruct the socioeconomic status and/or ethnicity of the households occupying the site?
- Initial examination of the existing well feature suggests that it has been blocked with deposited field cobbles following abandonment of the residence. Does the well contain archeological remains below the field cobbles which could help us reconstruct life in this rural farmstead?

- Are there remains of the second structure (likely a barn) shown on the 1905 Century map? If so, is there evidence of its function remaining in the archeological record?

- Historical research on the property suggests that it was a rental home occupied by a series of tenant farmers, most working for the Houck family, who owned the residence and surrounding farmland. Previous research at the Jacob and Christina Houck House (Hartgen Archeological Associates 2003, 2008a) provided us information on their lifeways. How do the lives of tenants renting this property differ from those of their Houck Family landlords?
- Historical research revealed that several of these tenant farmers were African Americans living in the decades immediately following manumission of enslaved individuals in New York state. The Houck family is shown to have owned slaves as of the 1820 census (United States Census Bureau 1820). However, they continued to rely on labor provided by free African Americans long after that date. Can we recover information that would illuminate how ethnicity, social class and socioeconomic status were expressed and interrelated in rural New York communities during the 19th century? Can that data help us understand how African American laborers and former slave owners transitioned from enslaved labor to freedom?

5 Field Strategies and Methods

The survey methodology was completed according to the Data Retrieval Plan (DRP), and consisted of unit excavation, mechanical stripping of the topsoil, mechanical excavation of trenches within the foundation, and mechanical bisection of the well. Previous efforts to examine any contents of the well were hampered by a post-occupational deposit of field cobbles filling up to a depth of about five feet below the ground surface.

5.1 Mechanical Stripping and Trenching

Mechanical excavation of the topsoil was directed by the archeological crew. Topsoil stripping occurred within a designated area of archeological sensitivity. The plow zone was removed by a backhoe to a depth just above

the subsoil. Soils were piled next to the stripped area and investigated for artifacts. Backhoe excavations were photographed. Archeologists scraped the ground surface using hand tools and inspected the subsoil for features. Potential archeological features were documented with photographs and measured scale drawings. Stripped areas and potential features were mapped with a Trimble Geo 7X GPS unit.

Trenches were excavated stratigraphically, and soils were piled next to each trench and investigated for artifacts. Trench walls were cleaned and examined for artifacts in trenches that were less than four feet deep, and the walls were profiled and photographed. Trench locations were mapped with a Trimble Geo 7X GPS unit.

5.2 Unit Excavation

Units were square with dimensions of 1 x 1 meter. Soil levels were excavated separately, and all excavated soil was passed through 0.25-inch hardware mesh and examined for both precontact (Native American) and historic artifacts. Soil depths, Munsell colors, textures, artifact content, and other relevant observations were recorded (Munsell Color 2000). Profiles and plan views were drawn when appropriate. The location of each unit was mapped with a Trimble Geo 7X GPS unit. Unit excavation fieldwork and unit wall stratigraphy was photographed.

6 Artifacts and Laboratory

6.1 Methodology

As general procedure, all precontact (Native American) cultural material identified during the fieldwork are collected. Significant historic artifacts such as glass, ceramics, food remains, hardware, and miscellaneous items are collected. Coal, ash, cinder, brick, and modern materials are noted. Any artifacts collected are placed in paper or plastic bags labeled by provenience and inventoried in a bag list. Bags are numbered in the field and transported to the Hartgen laboratory in the Town of North Greenbush, Rensselaer County, New York, for processing.

Shovel test records and other provenience information are entered into a Microsoft *Access* database. We are in the process of cleaning and cataloguing artifacts. Cataloging entails entering artifact provenience information, counts, weights, and descriptive information into the database.

6.2 Subconsultant Analysis

Faunal analysis was conducted on select samples by Marie-Lorraine Pipes, PhD, RPA of SUNY Geneseo. Faunal samples were sorted by class, species, and size range category, and were investigated for Total Number of Fragments (TNF) and the Minimum Number of Units (MNU), as well as skeletal element, portion, and age of death when possible. Furthermore, samples were categorized by type of meat unit and meat cut.

6.3 Curation

The cultural material assemblage from the data recovery study will make an important contribution to the study of New York history. As such, the collection should be placed in a suitable repository where it will be available for archeologists and other scholars to use in comparative analyses and studies. The New York State Museum (NYSM) is considered a suitable final repository for the collection. If the NYSM does not accept the collection, Hartgen will work with SHPO to find a viable alternative repository.

7 Results of Excavation of the J. Houck Historic Site (05704.000188)

Phase III archeological field reconnaissance was conducted between November 30 and December 16, 2020. The field crew consisted of Cynthia Jackson, Amy Wilson, David Wendell, and Matthew Hunt under the direction of Elizabeth Gregory. Matthew J. Kirk, MA, and Bradley Russell, PhD served as Principal Investigators.

Phase III archeological investigations consisted of unit excavation, mechanical stripping of the topsoil, mechanical trenching within the foundation and addition, bisection of the well, and feature documentation (Table 6).

Table 6. Summary of Phase III excavations

Field method	Qty/Area	Rationale	Results
Units	8 m^2	Investigate potential deposits near the well.	Low-density deposit identified south of the well.
		Investigate stratigraphy of fill within the foundation and identify potential deposits or living floor.	A layer of mortar was located beneath the post-depositional fill. Subsoil was reached below this layer in all units within the foundation.
		Identify boundaries of addition	Shallow units within addition suggest a more ephemeral structure or porch/patio
Mechanical stripping	Approx. 5,500 ft^2	Identify potential features in select areas of Loci 1-3	No archeological features were identified within the stripped area.
Mechanical trenching	3 trenches: (T1) 130 ft^2 (T2) 30 ft^2 (T3) 120 ft^2	(T1) Bisect the well feature to determine depth and identify potential archeological deposits	(T1) The base of well was reached around nine feet in depth. No significant cultural materials were recovered.
		(T2) Trench within the addition to investigate depth and construction	(T2) No substantial foundation or walls found in addition
		(T3) Trench within the foundation to investigate depth and construction	(T3) The base of the foundation was encountered around 2.9-3.3 feet in depth. The shallow depth indicates a crawlspace rather than a full cellar.

7.1 Units

A total of eight units, each measuring 1 square meter, were excavated during Phase III fieldwork (Units 10-17; Photo 1). Three of these units were placed within the original stone foundation (Units 10, 16, and 17). Unit 12 was placed just east of the original foundation, within the addition identified during Phase II fieldwork. Unit 13 was placed south of the foundation, at the entryway to the house. Units 14 and 15 were placed to verify the boundaries of the addition. Finally, Unit 11 was excavated south of the well to investigate any potential archeological deposits in this vicinity.

Unit 11, situated 50 centimeters south of the stone well, consisted of 14 centimeters of loose, soft very dark grayish brown silty loam. This was underlain by dark brown gravelly silty loam to a depth of 40 centimeters below the ground surface, and grayish brown. Beneath this, a pile of cobbles was noted in the northwest corner of Unit 11 at a depth between 43 and 59 centimeters below the ground surface. These large cobbles were not articulated, and it was suspected that these were discards associated with the construction of the well. Beneath this discard pile, mottled grayish brown, yellow brown, and brown silty loam subsoil was encountered. The mottling in the subsoil is indicative of an area that is consistently wet. This unit contained a low density of historic cultural materials. No concentration of cultural materials was observed. A 1976 dime was the only item collected from the first 10-centimeter level. Artifacts were consistent with those found elsewhere on the site. Cultural materials associated with the occupation of the site were collected from the second stratum, including olive container glass, bottle glass, cut nails, and transfer-printed whiteware. A small pile of cobbles in the northwestern corner of the unit at a depth of 45-60 centimeters may have been a discard pile created during the construction of the well. No cultural materials were recovered at or below this depth.

Units 10, 16, and 17, excavated within the original foundation footprint, contained a post-occupational layer of approximately 30-50 centimeters of large cobbles. The soil within the cobble layer was a black silty loam. Beneath the cobbles, soils consisted of very dark brown sandy silt to a depth of approximately 45 centimeters, underlain by about 7 centimeters of light brownish gray and pale brown sandy ash. The ashy layer was later determined to be disintegrated mortar. In Unit 16, a wooden board measuring 59 centimeters in length by 13 centimeters in width by 8 centimeters in depth was encountered running in a north-south direction at a depth

of 52-60 centimeters. Another board was roughly in line lengthwise with the first, with a 20-centimeter gap between the two ends. This coincided with the base of the mortar layer.

Beneath the mortar layer, soils consisted of approximately 11 centimeters of yellowish-brown silty clay, which transitioned to a thin lens of very dark gray-brown sandy loam atop brown silty clay with pieces of degrading shale. Unit 16 encountered sandier soils at the base of excavations. Excavations were terminated at a depth of 80 centimeters below the datum, as this was below the base of the foundation and the brown silty clay and olive brown sandy loam were determined to be B horizon soils. Far fewer artifacts were collected beneath the mortar layer. Units 10 and 16 encountered the base of the original foundation at a depth of approximately 60 centimeters below the datum.

A number of glass bottles, whiteware, stoneware, faunal bone, a sample of window glass, redware, several buttons (including three shell-buttons), olive vessel glass, pipe stems, and cut nails were recovered from these units. Although the age of the materials generally correlated with depth, with modern materials on the surface and in the first stratum, whiteware was recovered between 48 and 60 centimeters below the opening depth. It appears that the majority of cultural materials contemporary with the occupation of the house were recovered from the mortar level. Materials including wire, mattress springs, concrete, modern bottle glass, brick fragments, metal fragments, and miscellaneous modern refuse were not collected.

Units 12 and 15 within the addition did not identify any substantial structural remains (Photo 3). Unit 12 consisted of a thin layer of topsoil atop redeposited field cobbles. The topsoil, a very dark grayish brown silty loam, continued beneath the cobble layer and was underlain by a light olive brown silty loam subsoil. Several artifacts were recovered from Level 1, thought to be the occupational level, but no features were identified. Small pieces of mortar were noted in the eastern portion of the unit. Cultural materials included Albany-slip stoneware, hand-painted, transfer-printed, and undecorated whiteware, pearlware, a decorated pipe stem, flat and curved colorless glass, cut nails, metal hardware, faunal bones, clam shells, and mortar. No cultural materials were recovered from the subsoil, which began at a depth of 35 centimeters below the ground surface.

Unit 14, placed north of the house between the original foundation and the addition, confirmed that the structure did not extend north of the footprint proposed during Phase II work. This unit contained approximately 15 centimeters of very dark grayish brown silt loam over dark brown silt loam, which was underlain by a compact dark yellowish brown silty sand subsoil. Consistent with the rest of the site, ceramics including whiteware and yellowware, bottle glass, window glass, cut nails, metal hardware, shell, and faunal bone were recovered from the two upper strata of this unit. Unit 15 was excavated at the southeastern corner of the addition. Ceramic sherds (including whiteware), white salt-glazed stoneware, faunal bone, shell, cut nails, a metal spike, window and bottle glass, and pipe stems were collected from this unit. A large increase in the number of recovered nails was noted in Level 2 at a depth of 30-40 centimeters below the ground surface. This level also contained small cobbles in the northern portion of the unit, which may have marked the boundary of the addition. At a depth of 50 centimeters, however, the rocks extended throughout the unit.

Unit 13, located south of the foundation at the suspected entrance to the house, consisted of 15 centimeters of dark yellowish brown silty loam containing minimal historic cultural materials. This was underlain by 15 centimeters of brown silty loam and 10 centimeters of dark yellowish brown silty loam containing historic ceramic, window glass, and vessel glass, faunal bone, shell, and a button. Beginning at a depth of 40 centimeters, the silty loam levels were underlain by yellowish brown silty clay that is characteristic of the subsoil within the site. Unit 13 contained a large flat rock in the southeast corner 5 centimeters below the ground surface that may have been associated with a walkway or entryway. However, no other rocks were in this unit at this depth. Another large, flat stone was found in the southwestern corner of the unit at a depth of 40 centimeters below the ground surface. This was partially underlain by another rock and a brick. Artifacts recovered from this unit were consistent with those found throughout the site; notable finds included a button and a metal buckle.

As noted during Phase II archeological investigations, with the exception of the post-occupational deposits, the artifacts collected during the Phase III Data Retrieval appear to be consistent with an occupation lasting from the early to mid-19th century until the early 20th.

7.2 Mechanical bisection of the well

Trench 1 was excavated as an east-west bisect of the historic well, located northeast of the foundation (Map 2; Photo 4). The northern section of the well and the surrounding soils were removed, in addition to the post-occupational deposit of field cobbles within the well. This trench was excavated to determine the depth of the well and to identify potential archeological deposits within the well that may have been located beneath the cobbles.

Trench 1 was excavated to a total depth of approximately 10 feet below the ground surface. The base of the well was reached at around nine feet, and was marked by a large, flat stone. Bisection of the well identified a builder's trench extending approximately two feet on either side of the well. The well did not contain a significant cultural deposit; only one complete brick, brick fragments, and a dog collar were recovered (Figure 9).

Figure 9. A dog collar was recovered during mechanical excavations of the well (Item 99.1).

The well was photographed and documented with a measured-scale drawing (Drawing 5). Trench 1 was backfilled upon completion of this documentation (Photo 5).

7.3 Mechanical trenching within foundation

Trench 2 was excavated east of the original foundation through the northern portion of the addition (Photo 6). Excavations were terminated at a depth of approximately 1.5 meters below the ground surface, into the subsoil, to verify that no substantial foundation was present. As seen in Unit 12, small cobbles were located beneath a layer of topsoil. A line of similar small cobbles was noted beneath the larger deposit and appeared to be aligned north-south amid a dark stain in the subsoil. The cobbles were not articulated, and no mortar was observed between the stones. It is possible that these stones marked the easternmost extent of the addition. Mixed historic cultural materials were collected from the backdirt during excavations and appeared consistent with materials collected during excavation of Unit 12. Trench 2 was photographed and documented.

Trench 3 was excavated within the original portion of the foundation, to investigate the depth of the structure and identify a potential living floor (Photo 7). This trench, excavated in the northern half of the foundation, measured around 8 square meters. The stratigraphy observed during trenching was consistent with that seen in Units 10, 16, and 17 (Photo 2). The base of the foundation was reached at a depth of around 90-100 centimeters below the ground surface. The trench was excavated to a depth of about 135 centimeters below

the ground surface within the foundation, into the subsoil, to ensure the base of the foundation was reached. The exposed portions of the northern and western walls were cleaned off, photographed, and documented with measured scale drawings. A redware drainage pipe was installed in the northwestern corner of the foundation, near the base of the stones. Given how wet the site was during the Phase I and II archeological investigations, it is not surprising that this would have been necessary to drain the cellar or crawlspace. A wooden plank was also documented in the northern wall near the base of the foundation, and may have been a part of a wooden floor within the crawlspace. A similar wooden plank was found at approximately the same depth in Unit 16. However, no other wooden elements were observed during unit excavation or trenching within the foundation.

The ashy layer observed during excavation of other units within the interior of the original foundation footprint was determined to be disintegrated mortar. All excavated trenches were backfilled upon completion of archeological investigation and documentation.

7.4 Mechanical stripping

Mechanical stripping was conducted in the area to the north and west of the foundation. The topsoil was removed by a Volvo backhoe with a toothless bucket from an area measuring approximately 500 square meters, to a level just above the subsoil. Archeologists scraped the uppermost portion of the subsoil stratum using hand tools to look for features. Artifacts were collected from the backdirt piles in three arbitrary sections: north, west, and northwest. Artifacts collected during the stripping were consistent with those found in the Phase I and II investigations, as well as other artifacts collected during Phase III fieldwork. These consisted primarily of glass bottles, ceramic sherds, metal, brick, and other miscellaneous debris. The remains of the collapsed chimney identified during Phase II fieldwork were noted along the western wall of the foundation. The bricks were cleared away to inspect the ground surface.

Several large rocks were observed just north of the foundation, but further examination indicated this was not a feature. No archeological features, including privies, barns, or other outbuildings, were observed within the stripped areas. The remains of the second structure shown on the 1905 Century map, likely a barn, were not identified during hand excavation or mechanical stripping in the vicinity of the foundation.

7.5 House

Unit 1 from the Phase II study was terminated after it filled with ground water and did not reach the floor of the cellar. Fortunately, site conditions during Phase III archeological investigations were far drier than they were during any of the previous investigations. As such, excavation of a sump was not necessary. Hand excavations reached the base of the foundation in the northeast corner, within Unit 10, at a depth of approximately 95 centimeters below the ground surface. The shallow depth of this feature indicates it may have been more of a crawlspace than a full cellar. Subsequently, the northern half of the foundation was mechanically excavated to expose and document the interior of the northern wall (Trench 3). Upon its completion, Trench 3 measured approximately 2 meters x 4 meters. A wood beam and unglazed redware drainage pipe were exposed in the northwest corner of the foundation. Wooden planks identified in Unit 16 running in a north-south direction at a depth of 52-60 centimeters coincided with the base of the disintegrated mortar layer and were identified at roughly the same depth as a wooden plank in the northern wall of the foundation. These may represent a portion of a wooden floor at the base of the foundation.

Phase II investigations suggested that the residential structure was expanded decades after the initial construction of the stone foundations and cellar. Phase III archeological fieldwork investigated whether a more detailed construction history and chronology of the residential structure and its possible additions could be reconstructed.

Units excavated in the vicinity of the house and mechanical stripping conducted north, northwest, and west of the original foundation footprint did not identify a privy or any additional outbuildings. Phase III archeological investigations produced no evidence of other additions aside from the L-shaped addition identified during the Phase II fieldwork. Unit 14, excavated north of the foundation at the expected seam of the original foundation and addition, was placed to investigate the possibility of further additions to the north. No structural features

were noted in Unit 14. The unit appeared to be situated outside of the house footprint, confirming that there was not another addition extending northward. Furthermore, mechanical stripping north, northwest, and west of the house did not provide any evidence that the house had been further expanded.

7.6 Artifact Analysis

Historic cultural materials collected during archeological investigations of the J. Houck Historic Site are consistent with the site's use as a tenant farmhouse throughout much of the 19th century into the early 20th century. Although historic cultural materials collected throughout the J. Houck Historic Site ranged in date between the early 19th century and the mid-20th century, most artifacts appeared to date to the late 19th century.

A significant number of post-occupational materials were also recovered, generally dating between 1920-1940. These artifacts tended to be deposited at or near the ground surface, including the stripped area north and west of the original foundation footprint, and around the cobble layer within the original foundation footprint.

7.7 Distribution Patterns and Activity Areas

Artifacts were categorized by functional groups to investigate distribution patterns and possible activity areas within the site. Functional groups included domestic artifacts, architectural items, food, activities, personal items, hardware, and furniture. Artifacts were examined for additional information, including possible dates, and date and function were analyzed to link artifacts to occupants of the property. Upon further investigation, several more specific categories emerged including sewing machine parts and buttons, children's toys, vessel glass, and kitchen and food related items.

Examination of cultural materials from a midden identified in Unit 1 during Phase II archeological investigations indicated that much of the midden material appear to have been discarded in the 1920s based on the latest Level 1/surface TPQ of 1923 from a kerosene lamp base. The deposit also contained a significant amount of earlier material with TPQs as early as 1805, from grey bodied stoneware. These may have been deposited at an earlier date, suggesting a long accumulation of material. However, based on their clear association with later materials, it seems more likely that they had been curated for some time before being discarded in a midden formed after the house was demolished. The material from Level 2 appeared to be slightly earlier with the latest TPQ being 1905, the same year that the house was last shown on reliable historic maps. This suggested that the basement hole began being used as a dump soon after the structure was demolished.

This trend was also noted throughout Phase III archeological excavations. Earlier materials were recovered within the house footprint including a Kenrick's Patent Coffee Mill from Level 1 of Unit 17 (TPQ 1815) and the associated grinder, a fragment of ironstone from Trench 2 dated 1853-1861, and sherds of buff/pink-bodied salt-glazed stoneware associated with potter Nathaniel Hudson, dated c. 1850 through 1860 were recovered from Level 2 of Unit 11 as well as Levels 1 and 2 of Unit 10. However, these were also recovered from contexts associated with materials of a later date including cosmetic jars and other vessel glass manufactured by the Hazel-Atlas Glass Co. (TPQ 1923), bottles manufactured by the Owens-Illinois Glass Co. (TPQ 1929), wire nails, and whiteware with a polychrome decal (popular c. 1890-1930).

Subsequent levels similarly contained slightly earlier materials like a Peter Dorni ball clay-white tobacco pipe with molded decoration recovered from Level 4 of Unit 15 (TPQ 1850), though items such as an unglazed buff bodied stoneware pie pan (c. 1880-1920), dating toward the end of the structure's occupation, were recovered near the base of the post-occupation deposits.

7.8 Sewing machine parts and buttons

Several artifacts associated with sewing activities were recovered during Phase III archeological investigations at the J. Houck Historic Site. These included a variety of buttons (Figure 12) and what appeared to be two sewing machine foot pedal parts (**Error! Reference source not found.** and Figure). Based on images in an 1897 Sears Roebuck and Co. catalog, the sewing machine parts appear to date to the late 19th century. The two

potential sewing machine parts were recovered from Unit 12 and Trench 3. They appear to be pieces of the foot pedal mechanism of a stand or drop head sewing machine (Sears Roebuck and Co. 1897: 698-702).

Figure 10. A part of a sewing machine foot pedal mechanism was recovered from Trench 3 (Item 108.8).

Figure 11. Sewing machine foot pedal was recovered from Unit 12 (Item 65.15).

The quantity and variety of buttons also indicate some clothing manufacturing occurred on the property, rather than simply everyday clothing repair needs. These included three shell buttons, one of which was made of mother-of-pearl, and six China buttons manufactured by the Prosser process (Figure 12). Buttons manufactured by this process became readily available around 1840. Two of the Prosser-type buttons were

decorated, one with a gingham type pattern, and the other with the circumference painted red. While dating such buttons by decoration is somewhat unreliable, the gingham-type decoration appears to have been popular beginning around 1840 as well. All Prosser buttons recovered during this investigation were the four-hole type, the most common form found on archeological sites.

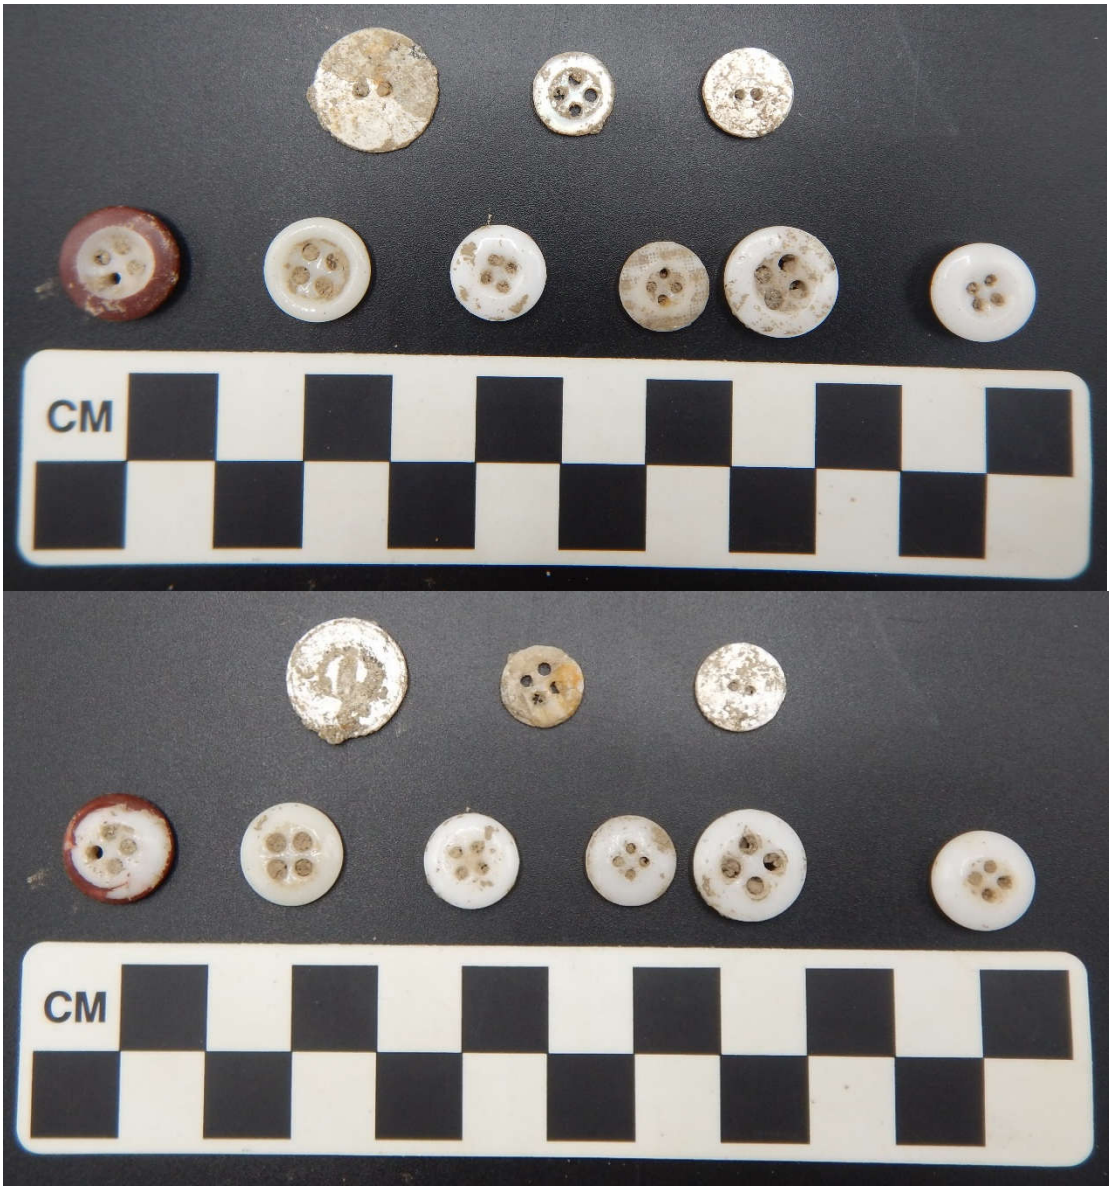

Figure 12. A variety of buttons were recovered throughout the site. Front (top photo) and rear (bottom photo) views. Top row (from left to right): Items 82.4, 86.4, and 86.5; Bottom row (from left to right): Items 59.7, 68.8, 69.8, 86.6, and 116.6.

The 1892 New York State Census records indicate that Grace A. Havens, wife of laborer Benjamin D. Havens, was a dressmaker who is believed to have resided at the J. Houck Historic Site. Both Grace and Benjamin were African Americans. Benjamin had resided on the Houck property for over 17 years, having been first recorded as a farm laborer for the Houcks on the 1875 New York State Census, and as a laborer living at the Houck Tenant Farmhouse on the 1880 Federal Census. The approximate date of the buttons and sewing machine parts recovered from this site correspond to the occupation of the house by Benjamin and Grace, and it is likely that these artifacts were used by Grace during her residence here.

Benjamin was born in the Town of Glen, Montgomery County, New York, in 1848 and was a lifelong resident of Montgomery County. The 1850 census records the family as "free inhabitants" residing in the Town of Glen. In 1860, 12-year-old Benjamin lived with his brother William H. Havens (13) and sister Mary L. Havens (4), as well as John Havens, a 51-year-old laborer, Lucinda Havens (32), and Rosa Havens (70). Although the three adults of the household could not read or write, William and Benjamin had both attended school within the year the census was recorded. Benjamin was recorded as a laborer at age 17, and later more specifically as a farm laborer along with his brother and father. He had moved out of his parents' house by 1875 and was recorded as a 24-year-old African American farm laborer from Montgomery County on the 1875 New York State Census. The 1880 Federal Census recorded Havens as a "servant" for the Houck family, with an occupation of "laborer."

Benjamin and Grace Havens were married around 1886. No marriage record is available for the couple. Little to no information is available about Grace's childhood, including her maiden name. The 1892 New York State Census records Benjamin (41), a laborer, and Grace (31), a dressmaker, residing on the Houck property. The couple did not have any children.

Like Jacob Houck, Benjamin Havens was active in the community and appears to have been well-liked. The *Troy Daily Times* noted in an article called "Amsterdam," dated August 8, 1896, that "a colored Republicans club has been organized with Benjamin Havens as president." An article in the *Amsterdam Evening Recorder* dated May 2, 1902, recorded that

> *The funeral of Benjamin Havens was held this morning at the African M.E. church on Cedar street, and was largely attended. The Rev. T.A. Auten officiated, and he was assisted by the Rev. J.R. Kyle of the First Reformed church. The internment was made at North Broadalbin. A large number of friends were present from out of town, and a delegation of Masons from Mt. Moriah lodge of Troy also attended.* (Montgomery County Historical Society)

Most of the artifacts that appear to be associated with Grace Havens and her occupation as a seamstress were recovered from the northeastern corner of the original house footprint (Units 10 and 16, Trench 3) and the northwestern corner of the house addition (Unit 12). Three buttons were recovered elsewhere within the site. Two were recovered from Unit 13, which was situated near the suspected entrance of the house. The third was recovered from the stripped area near the original house foundation.

Grace likely tended to her business in addition to the tasks generally assigned to women on the farm, such as raising poultry, milking and feeding the cows, sheep and goats; churning butter, as well as dressing and butchering animals culled from their herds (Bruegel 2002). The fact that Grace was also engaged in tailoring suggests she was active in the local community and developed economic relationships with neighbors and friends in the vicinity. Her domestic and wage labor likely provided her with a certain amount of individual autonomy within the Havens family, and may also suggest that she was responsible for purchasing many of the housewares, tablewares, and other goods and personal items within the tenant house during their stay.

Table 7. Artifacts likely associated with Grace A. Havens, by provenience

Provenience	Artifact ID	Description	Date
U 10 L 3	59.7	Button, four hole sew through, Prosser type, painted red around circumference, diam 1.5 cm	TPQ 1840
U 13 L 2	68.8	Button, four hole sew through, Prosser type	TPQ 1840
U 13 L 3	69.8	Button, four hole sew through, Prosser type, diam 0.8 cm	TPQ 1840
U 16 L 2	82.4	Button, two hole sew through, shell, diam 1.1 cm	
U 16 L 3	86.4	Button, four hole sew through, shell/mother of pearl, diam 0.7 cm	Popularity peaked c. late 19th-early 20th c.
U 16 L 3	86.5	Button, two hole sew through, shell, diam 0.8 cm	
U 16 L 3	86.6.1	Button, four hole sew through, Prosser type, diam 1 cm	TPQ 1840
U 16 L3	86.6.2	Button, four hole sew through, Prosser type, diam 0.8 cm, plaid/checkered pattern	TPQ 1840
GP	115.6	Button, four hole sew through, Prosser type	TPQ 1840

Provenience	Artifact ID	Description	Date
Unit 12	65.15	Sewing machine foot pedal	Late 19th-century (post-Civil War)
Trench 3	108.8	Possibly associated with sewing machine foot pedal mechanism	Late 19th-century (post-Civil War)

Rural African Americans in the late 19th century were oftentimes transient. After the couple's move to Amsterdam, they were recorded at three different residences within 0.1 mile of one another, 45 Arch Street, 40 Center Street, and 45 Florida Avenue (Figure 13). These were all situated approximately 1.8 miles east of the J. Houck Historic Site. The U.S. City Directory for Amsterdam, NY records the couple residing at 40 Centre Street, Amsterdam, NY, in 1893 where Grace continued her dressmaking business while Benjamin worked as a coachman. They lived here for at least three years.

The 1900 census records Benjamin Havens (b. April 1854), aged 46, lived in Amsterdam Ward 5, Montgomery County on 45 Arch Street. He was married to Grace Havens (b. March 1860), aged 40, in 1886, and at the time of the census the couple had been married for 14 years. He was listed as a gardener, both could read and write, and the couple rented a house. The couple did not have any children. Both had been employed the entire year. They resided with Malissa M Havens (64), Benjamin's widowed aunt, born April 1836. She had five children, none of whom were living in 1900. She could also read and write. Today, 45 Arch Street is situated across the street from 40 Center Street.

By 1901, the family had moved to 45 Florida Avenue, which was located near their previous residence and was also situated approximately 1.8 miles east of the J. Houck Historic Site. Benjamin was listed as a farmer in the city directory and probably commuted to work at the Houck farm.

Figure 13. Residences of Benjamin and Grace Havens between 1893 and 1901. Base imagery courtesy of Google Earth.

7.9 Children's Toys

Although Benjamin and Grace Havens did not have children, historical records indicate that at least several children of other farm laborers resided on the property at one time or another. The remnants of children's toys, including bisque doll parts and an unglazed porcelain marble, were recovered from Units 13, 15, and 16

during Phase III archeological investigations. These toys generally dated to the late 19th century. Three additional toys were recovered during Phase II archeological investigations and included a glass marble and metal toy car from Unit 7, and a porcelain doll head from Unit 1. The toys recovered from Unit 7 were later in date, perhaps as late as the 1920s, while the porcelain doll head looks similar to German-made porcelain dolls popular in the early 20th century.

Marbles are inexpensive toys that have been produced in a variety of forms for centuries. Painted unglazed porcelain marbles such as the one recovered from Level 3 of Unit 15 were first produced in Germany in the early 1800s but became popular in the United States after about 1850. It appears that the decoration was developed in response to competition from new decorative glass marbles that became available around 1846 (Herring Run Archaeology Project 2019). According to Carskadden and Gartley, most of the toy marbles found on 19th-century American archeological sites were originally imported from Germany. It was not until the first decade of the 20th century that commercial marble production, particularly for mass production of glass marbles, really took off in the United States. Around World War I, improved production and marketing strategies, along with resistance to German-made products, meant that American-made marbles overtook their once-popular German counterparts. Porcelain marbles tend to be scarce in archeological assemblages dating c. 1900-1910 (Carskadden and Gartley 1990). This indicates that these marbles fell out of popularity fairly early in the first decade of the 20th century. By 1910, American machine-made glass marbles had become readily available to marble players, and that year will be used here to indicate, generally, the time after which porcelain marbles were no longer manufactured.

Figure 14. Children's toys collected during Phase III archeological investigations at the J. Houck Historic Site. Top, unglazed and decorated porcelain marble (Item 76.4); Bottom, bisque doll parts from left to right, Items 69.12, 89.3, and 75.7.

Interestingly, Germany had a thriving toy market for dolls as well, and the porcelain doll head collected from Level 1 of Unit 1 appears like similar German-made dolls produced in the early 20th century (Doll Reference 2004). Three bisque doll fragments were recovered from Units 13, 15, and 16. Bisque is unglazed porcelain, and these dolls often had color added for more realistic skin tones and facial features. However, none of the bisque doll parts recovered at the site had added color. Bisque dolls were first produced in the late 1860s and were popular through the early 20th century. Earlier bisque dolls were produced in France, with production

shifting to the Thuringia region of Germany in the 1880s and 90s (Van Patten 2019). Unlike marble production, Germany was able to reestablish some of its old trade in the porcelain doll market after World War I (Carskadden and Gartley 1990).

Table 8. Children's toys by provenience

Provenience	Artifact ID	Description	Date
U13 L3	69.12	Bisque doll parts	Late 19th c.
U15 L2	75.7	Bisque doll parts	Late 19th c.
U16 L5	89.3	Bisque doll parts	Late 19th c.
U15 L3	76.4	Marble – similar to German made unglazed porcelain	Late 19th c.
U7 L1	13.1	Glass marble	Midden trench, c. 1920s?
U7 L1	16.1	Metal toy car	Midden trench, c. 1920s?
U1 L1	8.1	Porcelain doll head	c. early 20th century, many German made

Of the tenants recorded as residents of the property in available state and federal census records between the mid- to late-19th century, there were only a few children listed. Some of these toys may have been associated with Minnie Lisdell, born in 1868, who resided on the J. Houck Historic Site in 1870 but had moved by 1880. Her father, Lorenzo, had been a laborer at the J. Houck Historic Site before becoming employed as a papermaker after the family's move.

Alternatively, some of these toys may have been associated with Frank Fero (b. 1866, aged 14) and his sister Josephine (Lois Josephine; aged 12), who were listed on the 1880 census. Their father Timothy (44) was a farmer while their mother Dorcas (Augusta Dorcas Sooper) kept house. Prior to their residence on the Houck farm, the family had lived with relative Christian C. Fero, his wife Mary Ann, and their daughter Hattie in the Town of Florida. Christian operated his own farm, and in 1870 had real estate holdings worth $6,000 and personal estate valued at $1,745. The 1869 Montgomery County Directory lists Christian as a farmer with Timothy in Scotch Bush. Christian died in Schenectady in 1904. The family appears to have moved from the Houck property by 1892, when Benjamin and Grace Havens occupied the property. In 1896, Timothy resided at 12 Mohawk Place in Amsterdam and was employed as a cartman. Frank Fero was listed as a millhand, boarding at 68 Bridge Street in Amsterdam. Josephine was a millhand, boarding at 12 Mohawk Place with her parents. Dorcas passed away in 1910, while Timothy died in 1920.

The Sanders family had moved into the house by 1900. William J. (40) and Amelia (Gross) Sanders (39) had four children, Howard (14), a farm laborer, Seymore (12) and Morris (9), who attended school, and toddler Erving (2). The family had moved out by 1910.

Given the transient nature of tenant farmers during this time, it is also possible that these toys may have belonged to children of workers that resided on the property between census records and were therefore not recorded.

7.10 Architectural Artifacts

Architectural elements were the second largest functional category of historic cultural materials collected during Phase III archeological investigations, behind domestic artifacts. Architectural elements collected during Phase III archeological field investigations included brick, door hardware, dressed stone, brackets, locks/lock parts, mortar, nails, plaster, spikes, and window glass.

Table 9. Architectural artifacts by provenience

	U10	U11	U12	U13	U14	U15	U16	U17	T2	T3	GP	Total
Window glass	9	6	23	22	44	30	42	47		4	4	231
Nails	17	10	66	21	30	83	85	6	3	3		324
Brick				3	1	1	1	1			1	8
Spikes						4	1					5
Mortar			1					1		7		9
Plaster							2			1		3

	U10	U11	U12	U13	U14	U15	U16	U17	T2	T3	GP	Total
Architectural element							2					2
Door hardware							1					1
Lock/lock part								1				1
Bracket								1				1
Dressed stone									1	1		2
Total	*26*	*16*	*90*	*46*	*75*	*118*	*134*	*57*	*4*	*16*	*5*	*587*

As expected, nails and window glass comprised the majority (94%) of architectural artifacts collected during Phase III archeological investigations. These were also recovered from nearly every context. Door hardware, brackets, a lock part, dressed stone, and other miscellaneous architectural elements each made up less than one percent of the total architectural elements recovered during Phase III investigations.

Most architectural artifacts were recovered from Units 12, 14, 15, and 16. Unit 14 was situated north of the house outside of the foundation footprint. Unit 15 was situated at the southeastern corner of the house addition, largely outside of the suspected footprint. Units 12 and 16, however, were located within the house footprint. Unit 12 was situated within the northwestern corner of the house addition while Unit 16 was situated within the northeastern portion of the original cellar hole, adjacent to the addition to the east. Interestingly, the largest quantity (134 artifacts, nearly 23% of the total collected) and variety of architectural artifacts were recovered from Unit 16. Architectural artifacts recovered from Unit 12 were mainly comprised of nails.

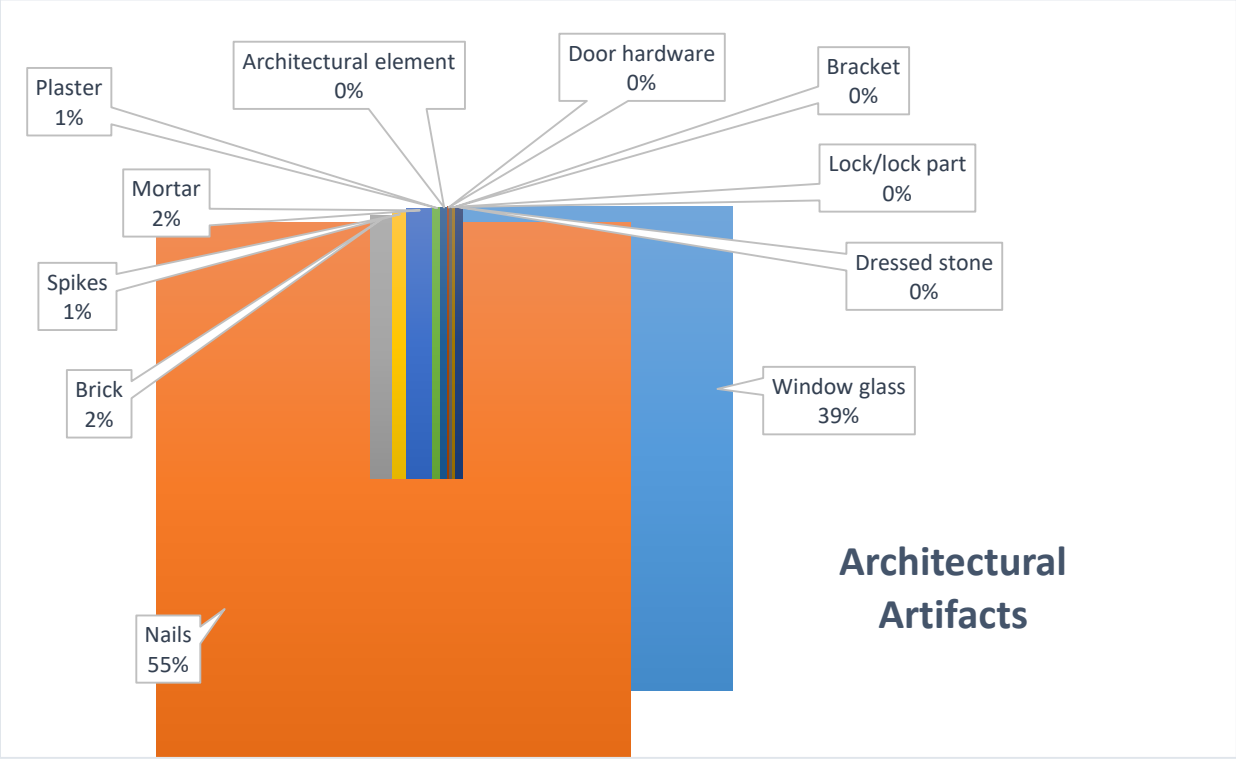

Figure 15. Architectural artifacts by type, as collected during Phase III archeological investigations.

Several significant architectural elements were recovered within the site. Unit 16 contained two architectural elements, including a finial, door hardware, and what appeared to be wooden floorboards near the base of the foundation. Level 1 of Unit 17 produced a possible handle, a latch type associated with a lock/lock part, and a bracket.

Figure 16. Architectural elements collected during Phase III investigations included (top left) a finial from Level 1 of Unit 16 (Item 80.9), (top center) door hardware from Level 3 of Unit 16 (Item 86.13), (bottom left) an unidentified architectural element from Level 1 of Unit 16 (Item 80.11), (bottom center) a possible handle from Level 1 of Unit 17 (Item 90.11), and (right) a lock/lock part (latch type) from Level 1 of Unit 17 (Item 91.12).

Figure 17. Trench 2 produced a slate fragment, while a fragment of dressed stone was recovered from Trench 3.

Architectural materials were recovered from Units 10, 12, 16, and 17 within the house footprint. Unit 16, within the interior of the original house foundation, contained the largest quantity of architectural artifacts recovered during Phase III investigations. Most of this architectural debris, including a brick, pale aqua window glass, and cut, wire, and indeterminate nails, was recovered from the post-occupational fill deposit within the foundation. Levels 4 and 5 each contained one fragment of window glass. Unit 12 also contained large quantities of architectural debris, primarily nails, all of which was collected from the first level of the unit. This may have been deposited during the removal of the structure. As seen in Unit 16, most architectural materials recovered from Unit 10 came from the post-occupational fill. Architectural materials were primarily recovered from Levels 2 and 3 of Unit 17, which included the mortar layer.

Architectural materials were also recovered from Units 13, 14, and 15, outside of the house footprint. Most architectural artifacts from Unit 13, situated near the suspected doorway at the southwest corner of the house, were recovered from Levels 1 and 2. North of the house, architectural artifacts were recovered to a depth of 63 centimeters below the ground surface in Unit 14. Below this depth was what appeared to be sterile subsoil. Unit 15, situated at the southeastern corner of the addition, contained architectural materials to a depth of 60 centimeters below the ground surface. However, most were recovered within the first 50 centimeters.

Architectural materials recovered near the well consisted of 10 nails and 6 shards of window glass. Cut nails and window glass were recovered from Levels 2 and 3 of Unit 11.

Interestingly, most of the architectural artifacts were recovered from Units 15 and 16 (Figure 18). This may have been due to the distribution of post-occupational fill deposits after demolition of the structure.

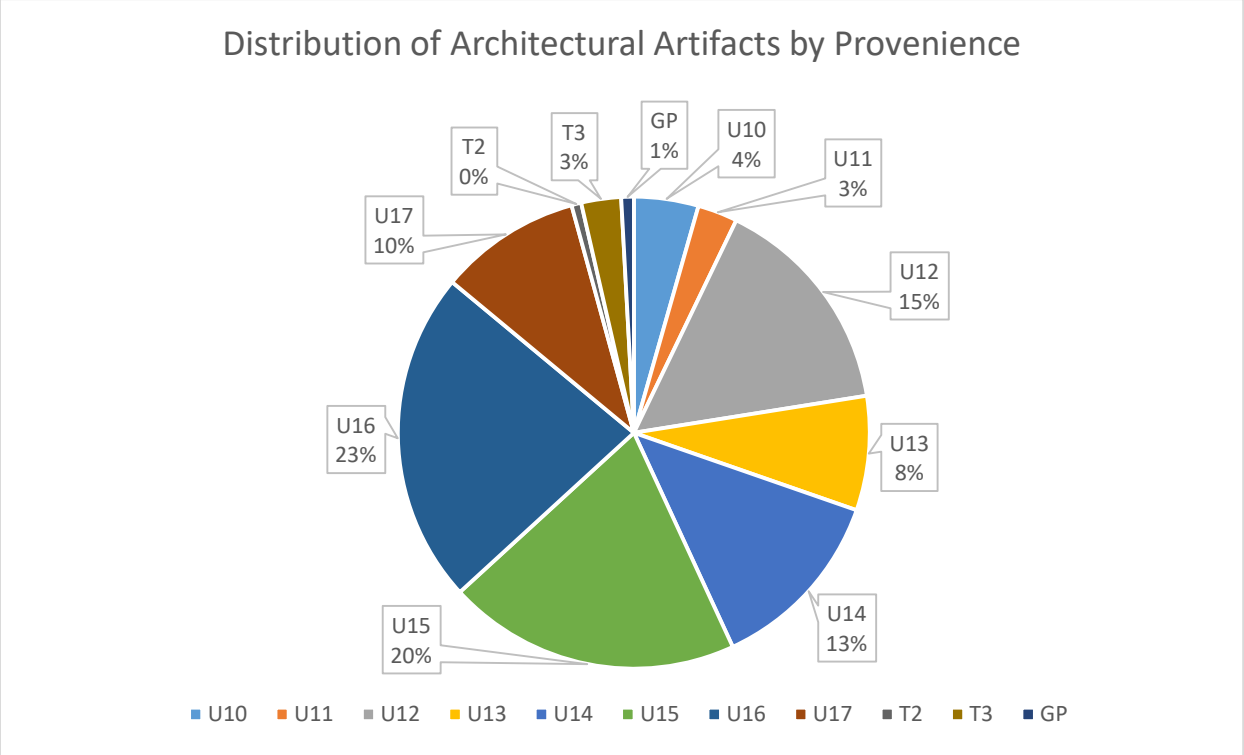

Figure 18. The distribution of architectural artifacts by provenience. The majority of architectural materials were recovered from Units 15 and 16.

7.11 Agricultural Artifacts

As the J. Houck Historic Site was part of a historic farmstead, it is not surprising that several agricultural artifacts were recovered throughout the site. Items collected during Phase III archeological investigations included a hand tool, three horseshoes, and a whetstone, as highlighted in gray in the following table. Additional agricultural artifacts were collected during Phase II archeological investigations, as listed in Table 10.

Table 10. Agricultural artifacts collected during Phase II and III investigations, listed by provenience

Provenience	Artifact ID	Description
U14 L1	71.3	Hand tool
U17 L1	91.11	Horseshoe
U17 L1	91.11	Horseshoe
T3 L1	106.5	Horseshoe
GP	115.5	Whetstone
U1 L1	40.24	Carbon rod
U1 L2	41. 17	Horseshoe
U1 L2	41.18	Agricultural tool
U1 L2	41.20	Carbon rod
U6 L1	49.6	Horseshoe
U7 L1	51.30	Wrench
U7 L1	51.36	Ceramic and iron machine part
U7 L1	51.37	Vacuum tube (TPQ 1904)
U7 L1	51.37	Vacuum tube (TPQ 1904)

Horseshoes were recovered from Unit 17 and Trench 3, within the original stone foundation. The horseshoes recovered from Unit 17 were deposited during the filling of the foundation.

Figure 19. Horseshoes recovered from Unit 17 and Trench 3 included a horseshoe with a toe calk for traction and medial heel calk (Item 106.5, left), a narrow horseshoe with a heel calk (Item 91.11, middle), and an additional horseshoe from Unit 17 (Items 91.11, right).

A whetstone was also recovered during mechanical stripping near the house (Figure 20). This sandstone tool would have likely been used to sharpen farm implements.

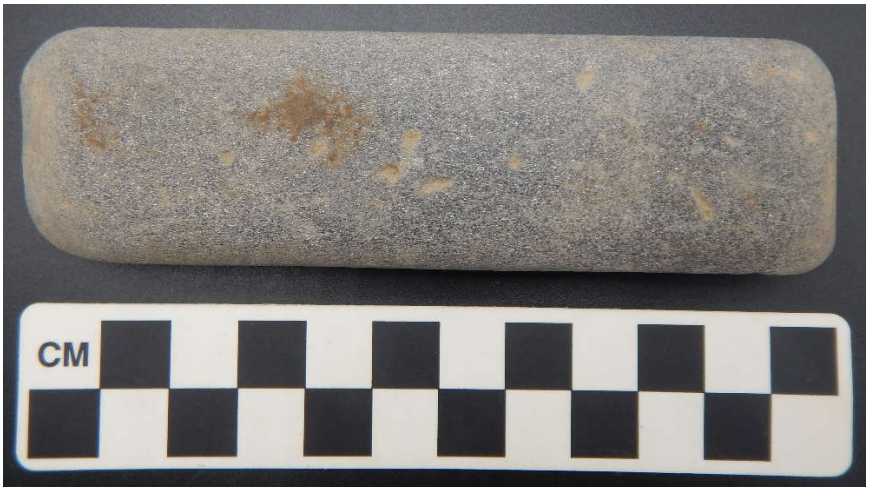

Figure 20. This whetstone was recovered during stripping north and west of the house (Item 115.5).

7.12 Vessel Glass

Some of the more definitive dates in areas of the site come from diagnostic fragments of vessel glass. These include pharmaceutical bottles, food and beverage-related vessels, cosmetic containers, and other miscellaneous vessel glass. Generally, diagnostic vessel glass recovered from the stripped area dated post-occupation. The TPQ dates of these vessels ranged between 1893 through 1929, with the majority having TPQ dates of 1919-1929. One Lummis Glass Co. embossed colorless threaded jar (Item 112.3) had a TPQ of 1940.

Within the original foundation footprint, vessels had a range of dates. These included a pale aqua embossed machine-made castoria medicine bottle with "Chas. H. Fletchier's" with a TPQ of 1870, but a more likely date of c. 1900-1940 (Item 105.5), a machine-made square bottle base embossed with "SMALLEY/ KIVLAN/ ONTHANK/ BOSTON" dating c. 1909-1920, and machine-made milk bottles embossed with "STEPHEN COLLINS/ ELMWOOD FARM/ AMSTERDAM, N.Y." dating c. 1900-1925 (Items 106.2 and 108.3) from Trench 3. A 19th century whiskey bottle was recovered from Level 3 of Unit 10.

Figure 21. Three examples of different bottle finishes represented in the artifact assemblage. Top: complete brown glass bottle with applied finish, c. 1830-1885 (Item 80.1.1), bottom left: machine-made brown glass bottle finish, TPQ 1899 (Item 80.1.3), and bottom right: pale aqua lipping-tooled glass bottle finish, c. 1885-1910 (Item 75.3).

Bottles from Units 16 and 17 also represented a range of dates. At the earliest, a complete brown bottle with an applied finish dating c. 1830-1855 was recovered from Level 1 of Unit 16 (Item 80.1), an olive green free blown bottle with an applied finish dating pre-1870 (Item 85.1), and possibly much earlier, was recovered from Level 2 of Unit 16, and a rectangular bottle base from the J.R. Watkins Co. recovered from Level 1 of Unit 17 was dated with a TPQ of 1868 (Item 90.2). At the latest two cosmetic jars manufactured by the Hazel-Atlas

Glass Co. with a zinc lid reading "HAIR-/GROOM" recovered from Level 1 of Unit 17 have TPQs of 1923 (Item 91.9 and 93.6), and an additional pharmaceutical jar with "MUSTEROLE/CLEVELAND" embossed on the base and molded on the lid dated c. 1926-1930 (Item 91.9). Most of the diagnostic vessel glass recovered from units within the foundation dated from the late 19th century through the early 20th century, toward the end of the site's occupation.

Most of an olive green free blown glass bottle with an applied finish was recovered from Level 2 of Unit 16 (Figure 22). The vessel included bubbles within the glass. Similar bottles generally date pre-1870 and may date much earlier.

Figure 22. Samples of some of the olive glass recovered from Level 2 of Unit 16 (Item 85.1).

Near the well, archeologists recovered a c. 1860-1890 "COLTON'S/ SELECT/ FLAVORS" extract bottle, a rectangular bottle base produced by the Illinois Glass Co. with a TPQ of 1911 (Item 62.5), and a paneled pale aqua bottle embossed with "KENNEDY'S … KINGSTON, N.Y. U.S.A." representing Dr. Kennedy's Favorite Remedy and dating c. 1880s-1890s (Item 62.5). All of these vessels were recovered from Level 2 of the unit.

Figure 23. Examples of diagnostic pharmaceutical bottles, including (top) a bottle embossed with "Kennedy's… /Kingston, N.Y. U.S.A." from Level 2 of Unit 11 (Items 62.5), (bottom left) "Chas. H. Fletchier's" castoria medicine bottle

from Trench 3 (Item 105.5), and (bottom right) a Knox Bottle Co. vessel with "Dr. Edward A/ Bogdan/58 Church St./Amsterdam, N.Y./Phone 126" acid etched on the bottle, recovered from the stripped area (Item 112.2).

Various food and beverage-related bottles were collected throughout the site. Those recovered from the stripped area generally had TPQ dates of 1919-1929, including an Owens-Illinois Glass Co. brown pectin measuring bottle (Item 112.2, TPQ 1929), a machine-made condiment bottle produced by the Owens Bottle Co. embossed with "PRIDE OF THE FARM/TOMATO CATSUP" (Item 113.2, TPQ 1919), and an embossed wine bottle base produced by the Owens Illinois Glass Co. (Item 116.2, TPQ 1929).

Figure 24. Examples of food and beverage-related glass containers recovered throughout the site. From left to right, a machine-made "Pride of the Farm/Tomato Catsup" bottle from the stripping area (Item 113.2), an embossed "American Soda Fountain Co" bottle from Level 2 of Unit 16 (Item 82.1), an embossed "Colton's/Select/Flavors" extract bottle from Level 2 of Unit 11 (Item 62.5), and an embossed wine bottle base manufactured by the Owens-Illinois Glass Co. from the stripped area (Item 116.2).

Several milk bottles were also recovered from the site. Two of these, recovered from Trench 3, were embossed with "ONE QUART/STEPHEN COLLINS/ELMWOOD FARM/AMSTERDAM N.Y./ REGISTERED," and were dated c. 1900-1925 (Figure 25). Available historical records indicate that the Houck farm was involved in relatively small-scale dairy production, maintaining anywhere between 4 and 6 milk cows between 1850 and 1880. Although the presence of the milk bottles could indicate that dairy was acquired from other nearby farms, given the late date range of the bottles and historical records of the Houck's dairy cows, it is more likely that these bottles were deposited post-occupation.

Figure 25. Two C. 1900-1925 milk bottles, embossed with "ONE QUART/ STEPHEN COLLINS/ ELMWOOD FARM/ AMSTERDAM N.Y./ REGISTERED," were recovered from Trench 3 (Item 106.2, left, and 108.3, right).

7.13 Kitchen Items, Food Remains, and Related Artifacts

In addition to vessel glass, a variety of kitchen-related domestic items and food remains were recovered during Phase III archeological investigations at the J. Houck Historic Site. These included ceramic artifacts, metal kitchen implements, and a variety of food remains including faunal bone and clam shells.

7.13.1.1 Ceramic Materials

Kitchen-related domestic items recovered during Phase III excavations consisted primarily of ceramic artifacts, which were found in every Unit and Trench excavated during the Phase III fieldwork except for Trench 1 (the well). Ceramic artifacts included coarse earthenware, refined earthenware, stoneware, and porcelain (Table 11).

Table 11. Ceramic artifacts by provenience

	U10	U11	U12	U13	U14	U15	U16	U17	T2	T3	GP	Total
Buff/pink-bodied stoneware	12	48		3				2		12	6	83
Gray-bodied stoneware	2	5	1			1					1	10
Hotel china											10	10
Ironstone				2					1			3
Porcelain	1		1	5				1		18	2	28
Semi-porcelain			2					8			9	19
Redware	1	2		4								7
White-bodied refined earthenware		2		7	6	2		1			2	20
Whiteware	56	33	10	29	34	27	2	61	2	27	69	350
Yellowware					1						1	2
Total	*72*	*90*	*14*	*50*	*41*	*30*	*2*	*73*	*3*	*57*	*100*	*532*

Ceramic artifacts were composed primarily of whiteware (both decorated and undecorated). In fact, whiteware comprised 66% of the total ceramic artifacts collected during Phase III archeological investigations. Buff/pink bodied stoneware was the second most popular category, in part due to the many sherds from a single vessel broken near the well, in Unit 11. Yellowware, ironstone, and unglazed redware were the least common ceramic artifacts recovered from the site.

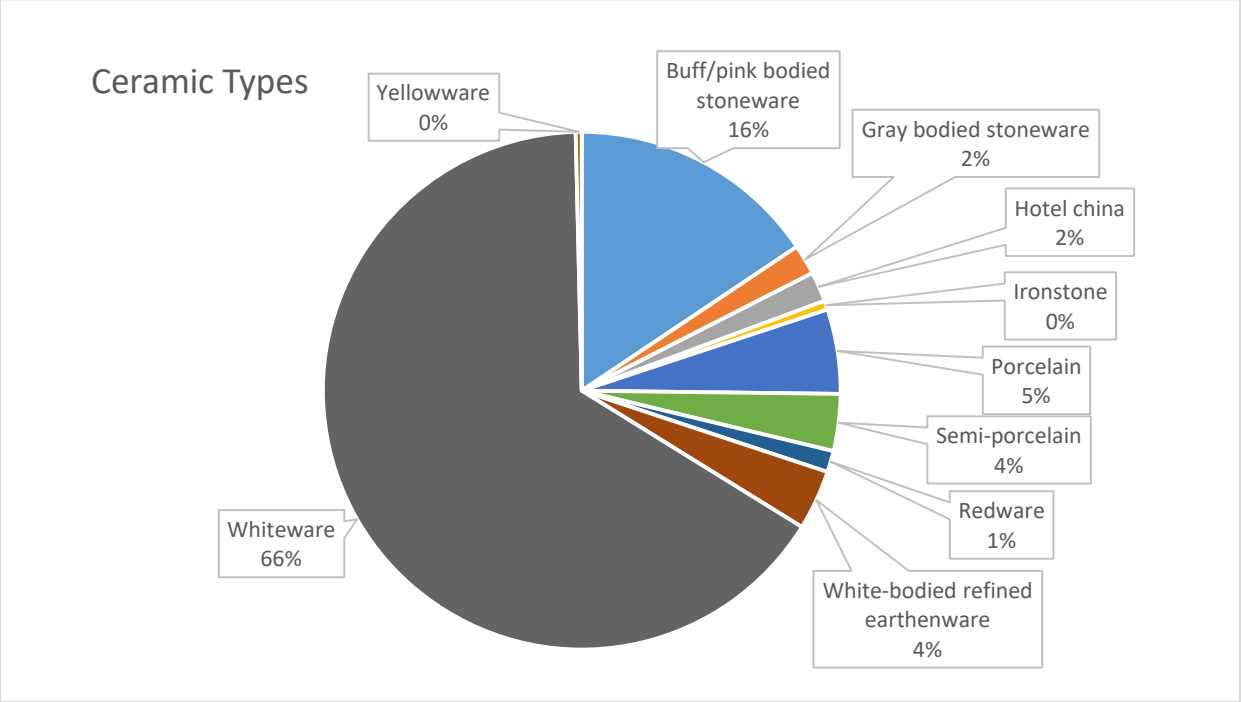

Figure 26. Quantities of ceramics by type as catalogued during Phase III archeological investigations at the J. Houck Historic Site.

Decorated whiteware appeared in several forms throughout the site, including underglaze transfer printing, shell-edged impressed whiteware, hand painted designs, gilded whiteware, decal designs, molded decoration, and flow transfer print. Whiteware became popular on American sites after 1820.

Figure 27. A variety of ceramic artifacts were recovered throughout the site, including these examples of decorated whiteware (Items 65.1, left) and semi-porcelain (Item 65.2, right) recovered from Level 1 of Unit 12.

Figure 28. A variety of ceramic artifacts were recovered throughout the site, including these examples of decorated whiteware recovered from the stripped area north and west of the foundation. From left to right, a cobalt blue flow transfer printed rim with molded decoration including beading, lines, and stars (Item 111.1.1), a decorated and lightly impressed shell edged rim sherd (Item 111.1.2), a whiteware rim with molded decoration (Item 111.1.3), a polychrome saucer (Item 111.1.4), and a decorated polychrome rim sherd (Item 111.1.5).

Some specific designs or decoration techniques can be assigned general dates or TPQs after 1820. For example, a fragment of whiteware with molded decoration and a polychrome decal recovered from Level 1 of Unit 10 has a TPQ of 1890 and was popular through the 1930s (Item 57.1.1). Unit 11 contained a whiteware rim with cobalt blue transfer printed underglaze design, which was popular c. 1820-1859 (Item 62.2.1). Similarly, a fragment of whiteware with a black transfer-printed underglaze design, popular between 1820 and 1864, was recovered from this same context (Item 62.2.3).

Unit 10 also contained several additional whiteware designs, including a gilded whiteware rim, a polychrome decal with leaves and flowers, a blue decal decoration with a bird design, and a green underglaze transfer-printed decoration. Similar designs were also recovered from Level 2 of Unit 10.

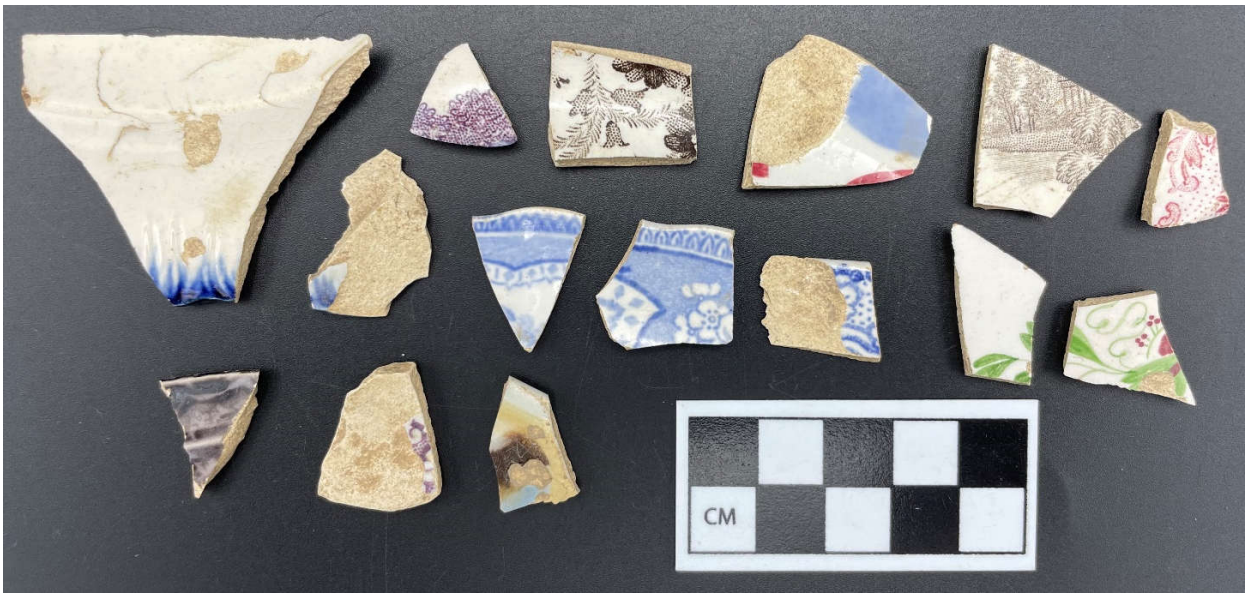

Figure 29. Variety of decorated whiteware collected from Level 2 of Unit 13, top two rows (Items 68.1), and Level 4 of Unit 14, bottom row (Item 73.1).

Level 2 of Unit 13 contained a variety of decorated whiteware including impressed cobalt blue shell-edged whiteware, transfer-printed underglaze decorations in cobalt blue, red, purple, brown, and black, in addition to hand-painted polychrome and green whiteware that appear to be part of the same pattern. Impressed shell-edged cobalt blue-painted whiteware was popular c. 1820-1850. The transfer-printing technique was also popular between 1820 and the mid-19th century. Level 4 of Unit 14 contained fragments of black flow transfer-printed whiteware, polychrome-dipped whiteware, and underglaze transfer-printed purple whiteware (Figure 29). Flow transfer -printed wares, such as the black printed sherds recovered from Level 3 (Items 72.1.1) and Level 4 (Item 73.1.1) of Unit 14 and Level 2 of Unit 15 (Item 75.1.1), have a TPQ of 1844 in North America.

The variety of whiteware found on site is likely due to the affordable nature of the product, and the transient nature of the numerous tenant farmers and their families who occupied the property throughout the 19th and early 20th centuries. Families who moved around frequently likely limited the quantity of cultural materials they acquired throughout the years to avoid having to move large amounts of personal possessions.

Only two sherds of yellowware, popular between 1830 and 1940, were recovered from the site. One, a fragment of a milk pan recovered from the stripped area, showed no additional decoration on either side, while the second was a small fragment of dipped polychrome yellowware with dendritic decoration recovered from Level 4 of Unit 14, north of the house (Figure 30). The dendritic style of decoration was popular on yellowware between about 1840 and World War I. The milk pan was a domestic utilitarian ware, the presence of which may indicate that a few milk cows were kept on site for personal, rather than commercial, use. In fact, the 1850-1880 agricultural census records show that the Houck farm maintained between 4 and 6 milk cows and produced anywhere between 800 pounds of cheese in 1850, to 400 pounds of cheese in 1870. The 1880 agricultural census record, which lists the J. Houck Historic Site separately from the larger Houck farmstead, indicates that six milk cows were under the supervision of tenant farmer Timothy Fero.

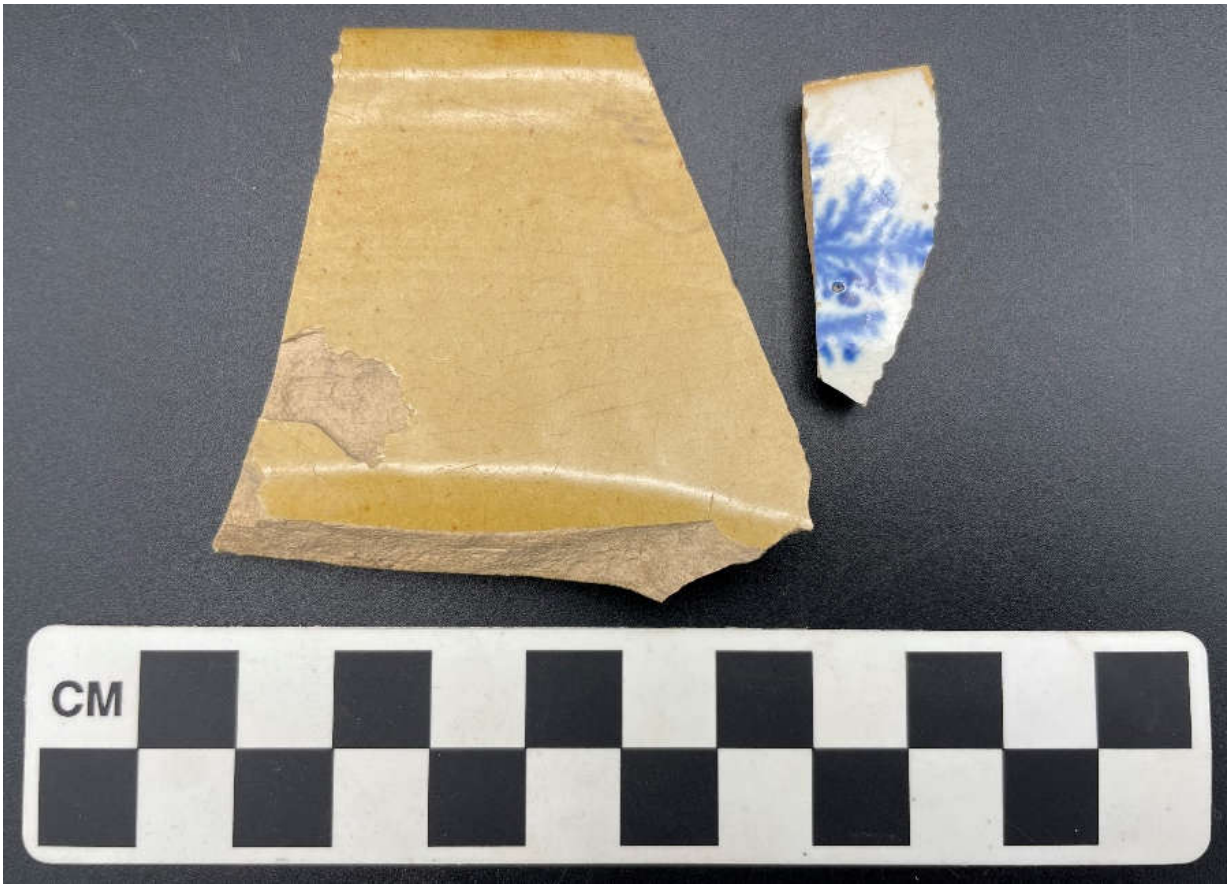

Figure 30. Two fragments of yellowware were collected during Phase III investigations, including a milk pan fragment from the stripped area (Item 111.3, left) and a dipped polychrome fragment with dendritic decoration recovered from Level 4 of Unit 14 (Item 73.3, right).

Stoneware was the second largest category of ceramic artifact recovered, after whiteware. A variety of stoneware was recovered throughout the site, including gray bodied salt glazed stoneware with a slipped interior, a gray bodied stoneware jug with Albany slip decoration, and gray-bodied slip-decorated hollowware, buff/pink-bodied salt-glazed stoneware with a metallic sheen, buff/pink-bodied salt-glazed impressed hollowware with cobalt blue decoration, unglazed buff/pink-bodied stoneware saucer with molded decoration, and Albany slip and salt glazed buff/pink bodied stoneware. Figure 31 depicts some of the stoneware described above.

Figure 31. A variety of stoneware was recovered throughout the site. From left to right, top: gray-bodied salt-glazed stoneware exterior (Item 111.5) and slipped interior (Item 65.3), and Albany slip and salt-glazed stoneware interior and exterior (Items 111.6); Bottom: Gray-bodied slip decorated hollowware body (Item 58.2), and salt-glazed buff/pink bodied stoneware jug exterior and slipped interior (Items 62.4.2).

Of particular interest are fragments of a stoneware jug with a metallic sheen (alkaline glaze). This vessel featured a salt-glazed buff/pink-bodied stoneware exterior and a slipped interior. Two fragments, which mend with one another, are imprinted with "…HANIEL HUDSON/GALWAY, VILLAGE, N.Y." Many other fragments associated with this vessel were recovered from adjacent Units 10 and 12, as well as from Unit 11. The stoneware jug may have been used to collect water at the well and may have broken here. Fragments were found at depths of up to 35 centimeters below the starting depth in Unit 10, and at depths between 11 and 22 centimeters below the ground surface in Unit 11. According to historical records, this vessel likely dates c. 1850-1865.

Figure 32. Several fragments of Nathaniel Hudson stoneware are represented in this photo, included base fragments from Bag 57.3 (top left), a piece of a handle from Bag 62.4.1 (bottom left), two body fragments from Bag 62.4.3 (right). Note the inscription on the central body fragment. Note the metallic sheen to the slip.

An early kiln was established in Galway, New York by Abraham Hodgson prior to 1850. Hodgson manufactured brick at the site. He changed his name to Hudson and had sold his pottery site by April 2, 1852, re-establishing the business at Galway Village as a stoneware manufacturer. This move was somewhat unusual, as it required transporting the stoneware clay approximately ten miles from an unloading point on the Erie Canal situated southeast of Galway Village. The business was in operation until at least 1866. Known makers marks denote several owners including Abraham Hudson, his son Natheniel/Nathaniel (at one time with a partner named French), and William A. Lewis (Ketchum 1987).

The 1850 and 1860 census records list "Nathaeniel Hodgson" (Hudson) as a potter, 42 years of age in 1850. Although Nathaniel is described as the owner in the 1859 New York State Business Directory, his father Abraham is recorded as a "stoneware man" in 1855 while Nathaniel is listed as a farmer. However, the 1856 Balch map of the Township depicts a building labeled "pottery" on the south side of present-day Ballston Road, situated next to the residence of N. Hudson. S. N. and D. G. Beer's 1866 New Topographical Atlas of Saratoga County depicts the same structure as a "stoneware factory." By 1865 Nathaniel Hudson was listed in the census as a brickmaker rather than a potter. The exact closing date of the pottery is unclear, as it is depicted on the 1866 map, but by 1870 no potters are listed in the community (Ketchum 1987: 231).

Table 12. Possible Nathaniel Hudson stoneware by provenience

Provenience	Artifact ID	Description
U10 L1	57.3	Buff/pink bodied salt glazed stoneware base with metallic sheen
U10 L1	57.3	Buff/pink bodied stoneware with metallic sheen
U10 L2	58.3	buff/pink bodied salt glazed stoneware base
U10 L2	58.3	buff/pink bodied salt-glazed stoneware
U11 L2	62.4	Buff/pink bodied salt-glazed stoneware jug, rim and handle, with metallic sheen. Fragments mend
U11 L2	62.4	Buff/pink bodied salt-glazed stoneware, some fragments mend. Appear to be part of 62.4.1 or 62.4.2 (jug)
U11 L2	62.4	Buff/pink bodied salt-glazed stoneware, impressed hollowware with cobalt blue decoration and metallic sheen, body fragments mend. Possibly part of 62.4.1 (jug)

Also of interest, fragments that comprised most of an unglazed bisque buff/pink bodied stoneware pie plate (Items 104.2.1 and 107.1.1) were recovered from Trench 3, and from the north wall near the base of the foundation (Figure 33). These were not situated beneath the foundation itself, but rather beneath the soil deposited post-occupation and immediately adjacent to the wall. The pie plate likely dates c. 1880s-1920s, and possibly even as late as the 1930s. The base is clearly wheel turned, but the crimped pattern on the outer edge of the plate was molded which indicates some sort of mass production.

Figure 33. Fragments of an unglazed buff/pink bodied stoneware pie plate were recovered from the northern portion of the original house footprint (Items 104.2 and 107.1).

When found, makers marks can be helpful in sourcing and dating ceramic artifacts. Two ceramic fragments with makers'-marks were recovered from the site, including a fragment of white-bodied refined earthenware

(Item 111.2) recovered from the stripped area, and a sherd of ironstone recovered from Trench 2 (Item 102.2). The fragment of white-bodied refined earthenware, stamped with "… IN HOLLAND/…CIETE CERAMIQUE…" is associated with "Societe Ceramique Maastricht," formed in 1863 in the city of Maastricht, the Netherlands. The sherd therefore has a TPQ of 1863. The company operated until 1958, when it merged with a competitor. However, the piece recovered from this site likely dates to the 19th century, as the company was more focused on the production of sanitary ware in the 20th century.

The second sherd reads "IMPERIAL IRONSTONE CHINA/JOHN ALCOCK." This piece has a transfer printed underglaze decoration and can be dated c. 1853-1861, the time during which John Alcock operated the business. Ironstone, also known as white granite, was popular between 1842 and 1930.

Figure 34. Makers' marks were identified on some of the ceramics recovered from the site, including this white-bodied refined earthenware sherd from the stripped area (Item 111.2, left) and this ironstone fragment from Trench 2 (Item 102.2, right).

Makers' marks were also noted on two later ceramic pieces. A fragment of hotel china collected from the stripped area west of the foundation contains a mark reading "Jackson Vitrified China" printed on its base (Item 110.1). This was produced by the Jackson China Company, located in Falls Creek, Pennsylvania, manufacturers of industrial restaurant tableware and several lines of fine "china."

Jackson China Company was established in 1914, and in 1916 was rebranded as Jackson Vitrified China Company, which operated through 1985. It is likely that this piece was part of the post occupational deposit observed throughout the site. Another fragment of hotel china recovered from the same context is marked with "O.P. CO. / SYRACUSE / CHINA / 9-Q" on its base (Item 110.1). The company began marking its pieces with "Syracuse China" in 1895, continuing this practice through the early 1970s. Again, it is likely that this piece was deposited at the site post occupation.

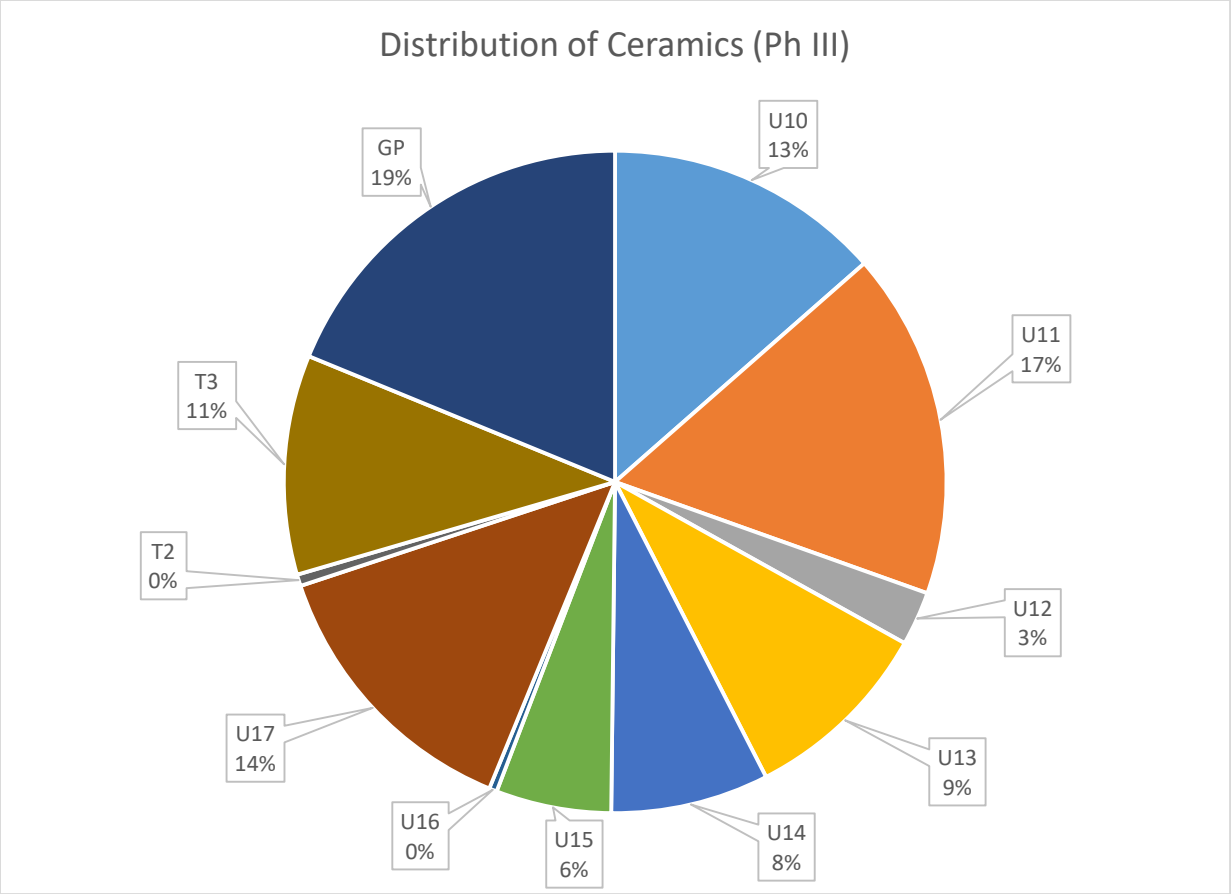

Figure 35. Distribution of ceramics recovered throughout the J. Houck Historic Site by Unit (U), Trench (T), and stripping area (GP).

Many of the ceramics recovered during Phase III archeological investigations were collected during mechanical stripping over a large area (19%), closely followed by those recovered from Unit 11, south of the well. Unit 11 produced 17% of the total ceramic materials collected, which included buff/pink bodied stoneware, gray bodied stoneware, redware, white-bodied refined earthenware, and whiteware. A large amount of stoneware, many sherds from the same vessel attributed to Nathaniel Hudson's company, were recovered near the well and may have been associated with vessels used to transport water from the well to the house.

Unit 17, in the northwestern portion of the original foundation produced 14% of ceramic artifacts and Unit 10, in the northeastern portion of the original footprint produced 13%. Trench 3 produced 11% of recovered ceramics. Unit 17 is situated near the brick fireplace back and stone hearth identified during Phase II investigations, in the area that may have been utilized as the kitchen.

Interestingly Units 13 and 14, located outside of the house to the north and southwest, respectively, each produced roughly the same percentage of ceramic artifacts. These items appear to be associated with vessels discarded outside of the house.

In comparison to the other contexts, very few ceramic materials were recovered from Unit 16, within the interior of the original foundation, or from Unit 12 and Trench 2, within the house addition. This could also indicate the kitchen's location closer to the western side of the original foundation footprint.

7.13.1.2 Kitchen Implements

Other kitchen-related items of interest collected during Phase III archeological investigations include a c. 1815-1850 coffee grinder and associated metal tag and a late 19th century enameled metal teapot spout recovered in the vicinity of Unit 17, and a large number of faunal remains collected throughout the site.

An enameled metal teapot spout and a metal coffee mill tag were recovered from Unit 17, situated in the northwest corner of the original foundation. This unit was located near the brick fireplace back and stone hearth identified during Phase II archeological investigations. This artifact appears to date to the late 19th century, as similar items were listed for sale in the 1897 Sears Roebuck & Co. catalog (Sears Roebuck and Co. 1897).

Figure 36. This c. late 19th century enameled teapot spout was recovered from Level 1 of Unit 17 (Item 92.5). Similar items were observed in the 1897 Sears Roebuck Co. catalog.

A complete mold-made brass tag was recovered from Level 1 of Unit 17. The tag reads "KENRICK'S PATENT/COFFEE MILL" with a royal coat of arms and has a TPQ of 1815 (Figure 38).

A cast iron and brass coffee grinder, presumably associated with the tag recovered from Unit 17, was recovered from deposits around the original foundation. The metal coffee grinder was nearly complete, weighing 2,280 grams (Figure 37). The cast iron grinding handle is missing its wooden knob. It appears to date sometime around the early- to mid-19th century. Ground coffee would be collected in the pull-out drawer at the bottom of the unit. There is some confusion about the exact date of the coffee grinder. The Smithsonian/National Museum of American History dates the artifact to both 1850 and c. 1815-1830 (National Museum of American History 2022). Presumably later models, such as the one pictured below, bore the inscription "A. Kenrick & Sons Patent Coffee Mill."

The company that manufactured this item was established as an iron foundry by Archibald Kenrick in 1791 in West Bromwich, Staffordshire. Kenrick advertised as "Archibald Kenrick, Ironfounder of West Bromwich." Kenrick began the manufacture of cast–iron hollowware, particularly for culinary use, in 1805. By 1812, the company was known as Archibald Kenrick & Co.. With the withdrawal of Kenrick's nephew and the addition of Kenrick's son to the team in 1827, the company reorganized as Archibald Kenrick & Son. Archibald Kenrick died in 1835. The company, presently known as Kenrick, is still in operation today with its headquarters situated

at the same site Archibald Kenrick purchased in 1791, on Spon Lane bordering the Birmingham canal (Archibald Kenrick & Sons 2019).

Figure 37. Coffee grinder recovered from the J. Houck Historic Site (Item 120.1, top) and a similar A. Kenrick & Sons cast iron and brass coffee mill grinder from an Etsy listing (bottom image courtesy of PaintedLadyAntiques, etsy.com).

Figure 38. Coffee grinder metal tag recovered from Unit 17, c. 1815-1830 (Item 92.4, left) and example of a similar A. Kenrick and Sons coffee mill tag from an Etsy listing (right image courtesy of PaintedLadyAntiques, etsy.com).

Based on the presence of the brick fireplace back along the western wall and the significant kitchen-related items including the coffee mill and its associated metal tag, and the enameled teapot spout, it appears that the kitchen was located on the west side of the original house footprint.

7.14 Distribution of Diagnostic Artifacts

The distribution of diagnostic ceramic artifacts, glass, and other materials throughout the site were also inspected. In general, many diagnostic artifacts within the stripped area dated c. 1920s-1930s, while artifacts in other contexts spanned the 19th century into the early 20th.

Many post-occupation artifacts were recovered from the stripped area, including vessel glass. These generally dated c. 1920s-1930s, with some dating even later. Two fragments of hotel china recovered from the stripped area west of the original foundation, with "Jackson Vitrified China" printed on the base of each, have TPQs of 1916 (Items 110.1.2 and 110.1.3). These dates are post-occupation and are consistent with a number of fragments of diagnostic vessel glass recovered from the stripped area.

However, some earlier cultural materials were also recovered from this area. Several other ceramic samples can be dated to the site's occupation, including the fragment of a yellowware milk pan (c. 1830-1940), two fragments of Albany slip & salt glazed stoneware (c. 1805-1920), and a fragment of white bodied refined earthenware associated with the "Societe Ceramique Maastricht" (TPQ 1863). One additional diagnostic piece, a fragment of whiteware with a molded decoration in a harvest motif, has a date of c. 1860s to the turn of the 20th century.

Artifacts recovered from Units 10, 16, and 17 within the original stone house footprint generally dated from the late 19th century through the early 20th century, toward the end of the site's occupation. This included much of the diagnostic vessel glass recovered from within the foundation and several types of decorated whiteware and other ceramics, such as whiteware with a polychrome decal, popular between 1890 and 1930. This corresponds with the suspected construction date of the addition, c. 1888. The increase in living space could explain the increase in cultural materials, as there was availability of storage space as well as higher capacity for occupants of the house.

However, both earlier and later historic cultural materials were also recovered from this context. Many of the historic cultural materials recovered within the original stone house foundation also dated post-occupation, as they were recovered in fill deposited after the removal of the structure. On the other hand, artifacts such as cobalt blue transfer printed underglaze whiteware (c. 1820 - mid-19th century), a Kenrick's Patent Coffee Mill (c. 1815-1850), and fragments of the Nathaniel Hudson stoneware vessel (c. 1850-1865) were also recovered within the foundation.

Also of note, fragments of an unglazed buff/pink-bodied stoneware pie plate (Items 104.2 and 107.1) were recovered from the northern portion of the original house footprint, beneath the fill soils. The pie plate likely dates c. 1880s-1920s, and even as late as the 1930s, toward the end of occupation and perhaps post-occupation of the site.

The mixed context of historical cultural materials within the foundation and throughout the stripped area is representative of the refuse deposition and filling activities that occurred after the abandonment of the site.

Fewer post-occupation cultural materials were recovered from the house addition, likely because this feature was not a cellar hole. The average date of diagnostic cultural materials recovered from this feature was slightly lower than the original cellar hole or the stripped area. A fragment of ironstone printed with "John Alcock" on its base was dated c. 1853-1861, while Unit 12 contained earlier materials such as wrought nails. Whiteware was present throughout these excavations, limiting the TPQ to 1820 or later. The Alcock ironstone was recovered within the house addition during excavation of Trench 2. Although it dates slightly earlier than the suspected construction date of c. 1888, this could indicate longer-term use of cultural materials on the site prior to disposal.

Like other contexts throughout the site Units 13, 14, and 15, situated outside of the house foundation, all contained whiteware throughout the artifact-bearing levels of each unit (TPQ 1820). Generally, artifacts from Unit 13 dated c. 1820 through the late 19th century. Whiteware was recovered from all four levels of Unit 13 containing cultural materials. Transfer-printed cobalt blue, red, purple, brown, and black whiteware, which was popular at various times between 1820 and 1880. Cobalt blue shell-edged whiteware, popular between 1820 and 1850, was also recovered from Unit 13. Prosser buttons (TPQ 1840) were also recovered from this unit.

Artifacts recovered from Unit 14 generally dated to the mid- to late-19th century. Whiteware (TPQ 1820) was recovered from all six levels containing cultural materials. Diagnostic decorated whiteware within this unit included flow transfer-printed black whiteware (TPQ 1844), transfer-printed purple whiteware (c. 1829-1867), and transfer-printed blue whiteware (c. 1820-1859). Yellowware (c. 1830-1940) was also recovered from this unit.

In Unit 15, whiteware was also recovered from all four artifact-bearing levels. Artifacts in Unit 15 generally dated from the mid- to late 19th century. This unit contained ironstone, (c. 1842-1930), black flow transfer-printed whiteware (TPQ 1844), and a Peter Dorni tobacco pipe (TPQ 1850).

All four levels of Unit 11, situated south of the well, also post-date 1820, based on the presence of whiteware throughout the unit. A United States dime dated 1976 was recovered from the upper portion of Level 1 of Unit 11. No other significant cultural materials were recovered from this level. Below this, artifacts generally spanned the 19th century, except for an Illinois Glass Co. bottle with a TPQ of 1911 in Level 2. Other diagnostic materials from this unit included Nathaniel Hudson stoneware (c. 1850-1865), a Colton's Select Flavors glass bottle (c. 1860-1890), and a Dr. Kennedy's Favorite Remedy glass bottle (c. 1880s-90s). Level 3 contained whiteware and a fragment of possible creamware (c. 1762-1820), along with whiteware (post-1820).

7.15 Food Remains

Food remains, including clam shells and faunal bone, were recovered from nearly all contexts during Phase III archeological investigations at the J. Houck Historic Site. The largest concentration of faunal bone was collected during stripping north and west of the foundation footprint, followed by that collected during trenching within the original foundation footprint (Trench 3). The largest concentrations of clam shells were recovered from Units 13 and 14, situated outside of the original foundation footprint to the south and northeast,

respectively. Approximately half of the total number of clam shells collected were recovered from these two tests. No food remains were recovered from Trench 1.

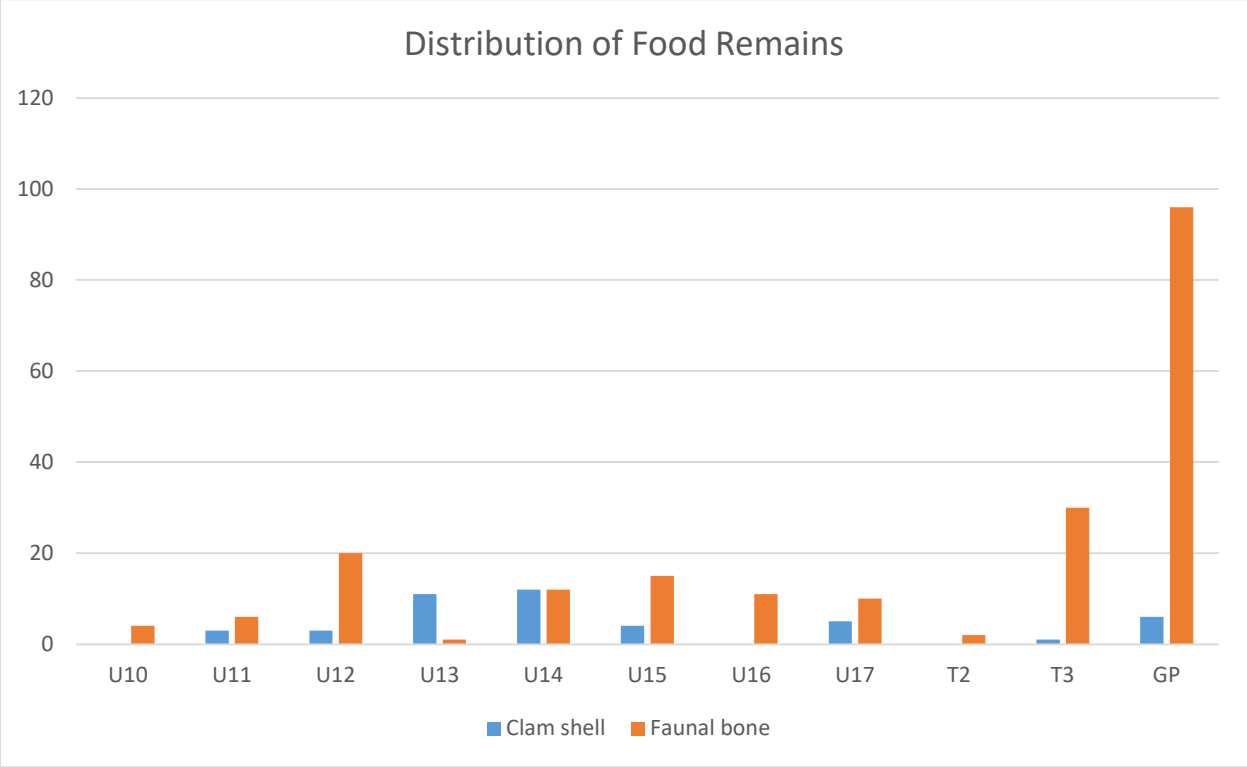

Figure 39. Distribution of food remains, including clam shell and faunal bone, recovered throughout the J. Houck Historic Site during Phase III archeological investigations.

Phase II and III archeological investigations recovered numerous large mammal (cow and pig) bones with evidence of butchering and cooking. Cow bone was the most common type of faunal bone recovered during Phase III archeological investigations. Additional samples included pig, sheep, various birds, and fish remains. Evidence of processing, including cutting, sawing, and other marks of butchering, were observed on numerous samples.

Figure 40. Faunal bone collected from Level 1 of Unit 12 included cow, pig, unidentified medium mammal, and duck remains (Items 65.10).

Figure 41. The most common type of food remains recovered during Phase III archeological investigations were cow bone, such as these samples from the stripping area (Items 113.3). Some bone, including two samples seen here, showed cutting, sawing, and other evidence of butchering.

Evidence of other food remains was recovered from several contexts within the J. Houck Historic Site during Phase I, II and III archeological investigations. A total of 45 clam shells and shell fragments were collected during Phase III archeological investigations from Units 11-15, Unit 17, Trench 3, and the stripping area. Additional shells were collected from Units 1-6 and Unit 8, as well as Tests 400, 2023, 2030-2032, and Test 2088. Many shells were collected in the immediate vicinity of the foundation, with a small number collected from Unit 11 south of the well.

Figure 42. Two samples of clam shells recovered from Level 1 of Unit 12 (Item 65.11).

7.16 Specialized Analyses

7.16.1 Faunal Analysis

A brief analysis of faunal remains collected during Phase II archeological investigations indicated that the Phase II faunal collection contained many large mammal (cow and pig) bones with evidence of butchering and cooking. The elements present were generally not from the meatiest "best cuts" which may reflect the lower socio-economic status of the occupants who, sources indicate, were renting the property from the Houck family. Several commensal species (primarily rodents) were also recovered. Much of the faunal bone showed cutting, sawing, and other evidence of butchering, and clam shells (some cut) were also collected throughout the site.

More intensive faunal analysis was conducted on select samples from Phase III archeological investigations by Marie-Lorraine Pipes, PhD, RPA of SUNY Geneseo (Pipes 2022). Faunal samples were selected from each provenience, including Units 10-17, Trenches 2 and 3, and the stripping area north and west of the original foundation. Trench 1 did not contain any faunal bone.

Faunal samples were sorted by class, species, and size range category, and were investigated for Total Number of Fragments (TNF) and the Minimum Number of Units (MNU), as well as skeletal element, portion, and age of death when possible. Furthermore, samples were categorized by type of meat unit and meat cut. The complete faunal report is presented in Appendix 2.

Table 13. Samples selected for faunal analysis

Bag	Item #	Provenience	Count
57	14	Unit 10	3
63	6	Unit 11	6
65	10	Unit 12	20
68	7	Unit 13	1
73	8	Unit 14	6
74	5	Unit 15	10
76	8	Unit 15	3

Bag	Item #	Provenience	Count
80	16	Unit 16	4
91	27	Unit 17	4
102	5	Trench 2	2
105	10	Trench 3	17
106	7	Trench 3	2
107	2	Trench 3	1
112	10	GP	71
113	3	GP	4
114	10	GP	20
Total			*174*

Faunal remains were mainly composed of domesticated mammal and bird species, though some remains suggest intrusive wildlife such as New England cottontail (Trench 3), striped skunk (Unit 15), and woodchuck (Unit 16). Additionally, the remains of unidentified fish were recovered from the stripped area. Trenches and units yielded primarily mammal remains, whereas the stripped area was more diversified by class and species and had a greater number of bird remains. In general, the deposits were composed of dietary refuse.

Many of the samples collected from Phase II and III archeological investigations showed marks from cutting, sawing, and other evidence of butchering. More specifically, cuts of cattle, pig, and sheep meat analyzed by Pipes displayed saw, cleaver, and chop marks.

Occupants of the J. Houck Historic Site consumed a varied diet of domesticated mammals including cow and pig, domesticated birds including chicken, duck, and goose, sheep, fish, and clams. Additionally, a variety of cuts of beef and pork were represented in the samples analyzed by Dr. Pipes. One single sample of veal was identified, which consisted of a leg roast.

Figure 43. Intrusive wildlife remains were found in several contexts, including five striped skunk bones in Unit 15 (Item 74.5). Unit 15 also contained the remains of an unidentified large mammal, an unidentified medium mammal, and a pig.

The three most abundant species represented by the faunal bones sampled and analyzed during Phase III archeological investigations were cattle, pig, and chicken, all domesticated animals. Available agricultural census records indicate that the Houck farm maintained a variety of livestock including horses, milk cows, other cattle, working oxen, sheep, swine, and, after 1860, poultry.

Landowner Jacob Houck and tenant farmer Timothy Fero are listed individually in the 1880 agricultural census. This indicates that the J. Houck Historic Site maintained its own animals in addition to the Houck's main farm. In 1880, the agricultural census lists 2 horses, 6 milk cows, 9 other cattle, and 12 poultry for the J. Houck Historic Site. No mules or asses, working oxen, sheep, or swine were listed under the supervision of Fero.

Cattle remains were recovered from adjacent Units 10, 12, and 16 as well as Unit 17 and Trenches 2 and 3, all within the house. Additional cow remains were recovered in the stripping area north and west of the house. Pig remains were recovered from Unit 12 and Trench 2 in the northern portion of the house addition, as well as Unit 15, near the southeastern corner of the addition, and Unit 14, excavated just north of the house. Chicken and other bird remains were recovered primarily from the stripping area, with one sample collected from Trench 3. Three cuts of sheep were also recovered. All of these were situated in the stripped area north and west of the foundation.

Figure 44. These faunal remains recovered during excavation of Trench 3 consisted primarily of cow, but also included chicken, an unidentified large bird, and intrusive wildlife New England cottontail (Item 105.10).

Bird remains included those of chickens, duck, and goose, and were primarily recovered from the stripped area north and west of the original foundation footprint (Bags 112 and 114). Bird bones included samples from the neck, wing, breast and leg of at least three individuals. A small number of bird remains were also recovered from adjacent Units 10 and 12, and from Trench 3. Medullary bone was noted in one femur fragment, which is produced in females when they are laying eggs, suggesting that birds were raised on site. Agricultural census records also support this conclusion, noting that Jacob Houck maintained 210 poultry in 1870 and 120 in 1880. Timothy Fero was also reported to maintain 12 poultry in 1880.

Residents of the J. Houck Historic site also enjoyed fish in their diet. Unidentified fish remains "consisted mainly of fragmentary cranial plates and a few vertebrae, all of which were found in Bag 112" (Pipes 2022).

Figure 45. Some smaller faunal bones, including bird and fish remains, were collected from the stripping area north and west of the foundation (Items 112.10.2).

Faunal remains recovered and analyzed during Phase III archeological investigations are consistent with available agricultural census records dated between 1850 and 1880, which listed livestock including sheep, cows, horses, pigs, mules and asses, other cattle, working oxen, and poultry.

The 1850 agricultural census indicates that Isaac Houck oversaw 4 milk cows and 9 other cattle. Jacob Houck maintained 5 milk cows and 20 other cattle in 1860, 6 milk cows and 6 other cattle in 1870, and 5 milk cows and 7 other cattle in 1880. Although the 1875 agricultural census records indicated cattle were being raised for beef by this time, cattle appeared to comprise a relatively small aspect of the commercial operations at the Houck farm. Similarly, low numbers of swine were recorded between 1850 and 1880, ranging between 3 and 9 animals.

Jacob Houck appears to have increased the focus on poultry toward the end of the 19th century, with 210 poultry recorded in 1870 and 120 poultry recorded in 1880. Additionally, the Houcks maintained 23 to 45

sheep between 1850 and 1880. Livestock production appears to have peaked around 1870, with a value of $2,590 recorded for that year. Livestock were valued at $1,400 in 1860 and $1,300 in 1880.

Figure 46. Three cow bones were analyzed from Unit 17 including two loin steaks, top, and a cut for short rib stew, bottom (Item 91.27). The bottom sample is sawed and shows evidence of gnaw marks from a rodent.

Pipes identified several bone modifications in the assemblage, including butcher marks, gnaw marks, heat exposure, and weathering. Pipes also grouped bone by refuse type within deposits, designating them either "dietary refuse," referring to meat bearing elements, or "processing waste," referring to cranial or foot elements used in soups or stews, or elements discarded during organ extractions like the removal of brain or tongue.

A brief analysis of food remains collected during Phase II fieldwork indicated that the elements present were generally not from the meatiest "best cuts," although faunal analysis on food remains collected during Phase III investigations indicated otherwise. A wide range of meat cuts were identified during faunal analysis, including a selection of roasts, steaks, and stews, in addition to some processed cuts. There was also a range of associated economic values of the cuts including high, medium, and low. However, overall, most cuts (particularly those of beef and veal) fell in the medium to low value range and were dominated by larger units of meat.

Tables 3 and 4 within the faunal report (Appendix 2) summarized the economic value of the cuts of veal, beef, and pork identified during faunal analysis. High quality cuts include steaks, beef sirloin or veal leg roasts, and pork loin rib-end chops. Medium quality cuts include rump, chuck, and arm roasts, short rib stew and chuck stew/grind beef and veal cuts and ham shank cuts, and low-quality cuts include stew and processed cuts.

Overall, 8 high quality cuts, 14 medium quality cuts, and 9 low quality cuts of veal and beef were identified, while 2 high quality, 1 medium quality, and 5 low quality cuts of pork were identified.

Pork cuts consisted of one chop, one ham, three stew meats and a processed cut. Most pig elements came from subadults and juveniles, and most of the cuts were of low economic value. A single cut of veal was included in the faunal samples, which consisted of a high-quality leg roast. Three meat cuts of sheep were sampled, all of which were loin-end chops.

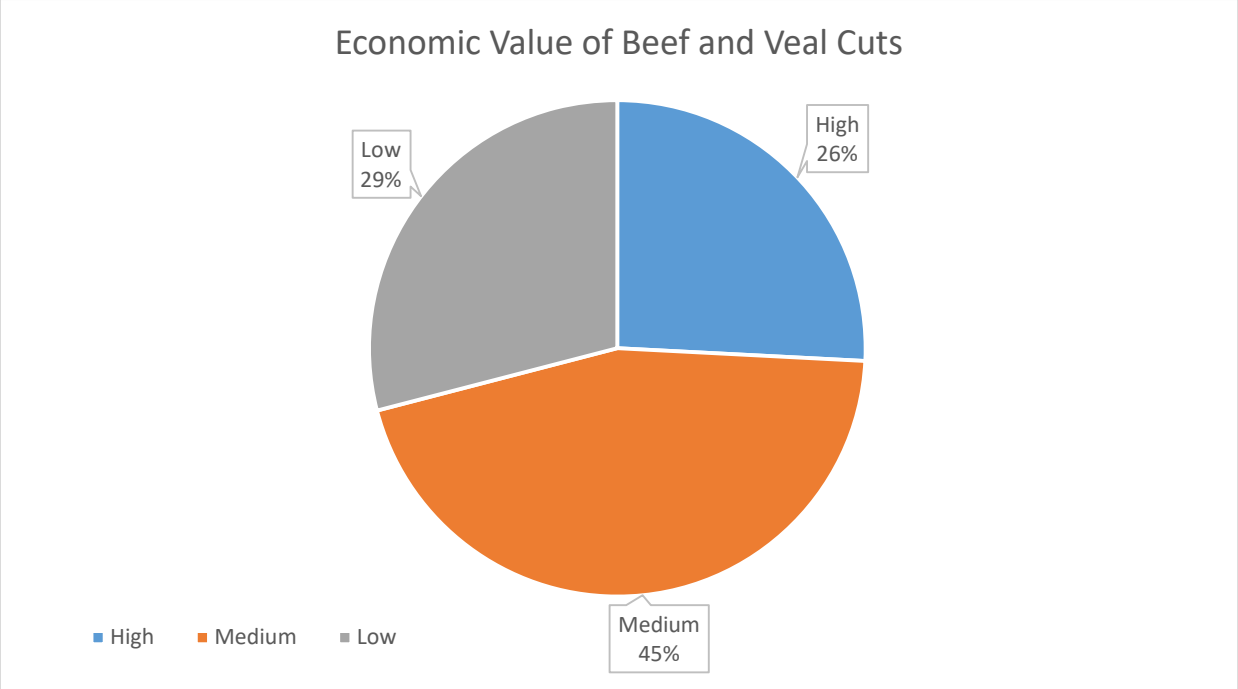

Figure 47. Most cuts fell into the medium to low value range, and primarily consisted of larger cuts of meat.

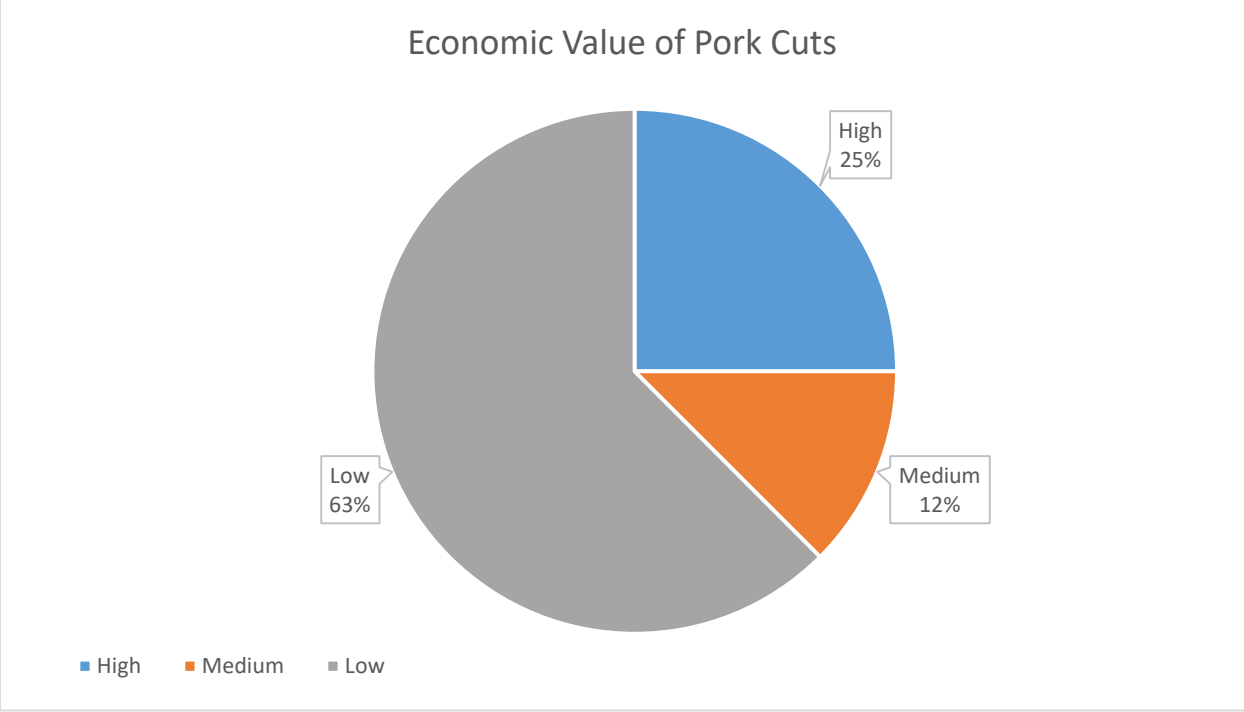

Figure 48. Most cuts of pork fell into the low economic value range and included three "trotter" stew cuts and two "head" processed cuts.

Phase II archeological investigations suggested that most of the food remains collected were of lower economic value and may reflect lower socio-economic status of the occupants, who sources indicate were renting the property from the Houck family. However, Pipes's faunal analysis indicated that the tenant farmers of the site and their families consumed a more varied diet than previously thought. Although large percentages of meat cuts identified during the present faunal analysis were categorized as cuts of low economic value, numerous medium and high-quality cuts of beef, veal, and pork were also identified.

Occupants of the J. Houck Historic Site appear to have consumed primarily medium quality rump, chuck, and arm roasts, short rib stew and chuck stew/grind beef and veal cuts, and low-quality pork cuts including trotter stew cuts and processed head cuts, in addition to chicken and other poultry raised on site. According to Pipes, "a few cranial elements indicate heads and mandibles were processed for tongue, brain, and facial tissue used for making cold cuts like headcheese" (Pipes 2022). Three meat cuts of sheep were identified, all of which were loin-end chops.

7.16.2 Architectural

Significant foundation remains of the J. Houck tenant house were recovered during archeological excavations at the site. The following assessment is confined to the earlier portion of the building, which was better preserved than its late-19th century addition.

The foundation of the house consisted of locally quarried stone dry-laid in approximately 1'-8" thick (.51 m) walls and measured 18'-4" (east-west) by 17'-4" (5.59m by 5.28m) in outside dimension, enclosing a cellar measuring 15 by 14 feet (4.57m by 4.27m) in size. Above the original exterior grade (approximately 16 inches or 40 cm), three courses of masonry were more regular and of larger size. In this respect, this foundation was like the Jacob and Christina Houck house and may point to the same mason being responsible for both.

The foundation extended four feet (1.2 m) below the three regularly coursed rows of masonry, indicating the lack of a fully excavated basement. No basement windows were indicated in the surviving portions of the foundation. The careful alignment of the interior face of the foundation walls indicates that the space may have been used for food storage. One stone in the north wall of the foundation bore four drill holes, indicating its removal from a quarry by mechanical means, either by blasting or by wedges. A large supporting stone for a hearth arch was embedded in the center of the west wall of the foundation. It would have served to support a brick or wood arch that in turn would have supported the hearthstone of the fireplace above.

Bricks found on-site were embedded in the foundation walls as part of the original construction and were also found in the vicinity of the hearth support, outside the foundation. Examples collected measure 7 ¾" x 2" x 3 5/8" (Bag 79, item 1), 8" x 2" x 3 ¾" (Bag 117, item 1), and 8" x 2" x 3 5/8" (Bag 101, item 1). Each of these is well-formed and highly fired, resulting in a brick of dense texture, heavy weight and dark purple-red color. That the bricks were not fired in a large-scale coal-fired kiln is indicated by the lack of striations on their side faces. Each of the examples from the J. Houck house were formed in a sanded mould, and bear indications on their top surface of having been scraped while still green.

Analogous examples from the Jacob and Christina Houck house, originally owned by the same family that owned this dwelling and constructed c. 1805, measured 7 ¾" x 2 1/8" x 3 5/8" and 8 1/8" x 2 ¼" x 3 7/8" in size. The size of these bricks is close to those recovered from the J. Houck house site.

If the brick recovered in the vicinity of the west end of the foundation originated in an externally expressed fireback, this would represent a third aspect of the construction of the J. Houck house that was shared with the Jacob and Christina Houck house, which featured two such brick firebacks (Figure 4).

8 Interpretation

Generally, 19th-century tenant farmers were transient. Available census records indicate that this was also true for many of the tenant farmers on the Houck farm, including the Lisdells and the Millers. Benjamin Havens,

however, was a notable exception. Conditions on the Houck farm appear to have been relatively favorable for tenant farmers and their families. For example, tenant farmer Benjamin Havens resided on the property for over 17 years. After his marriage to Grace in 1886, the couple lived on the Houck farm for several years before moving about two miles east to Amsterdam. Havens was listed as a farmer in city directories after his move and may have continued working for the Houcks (as a wage laborer) even after moving east with Grace.

Occupants of the J. Houck Historic Site consumed a varied diet that included a variety of cuts of beef, veal, and pork, as well as fish, clams, sheep, and poultry including chicken, duck, and goose. Most of the cuts of beef analyzed by Dr. Marie-Lorraine Pipes were of medium or low economic value, while the representative cuts of pork were primarily of low economic value. It appears that most of the food remains collected represented livestock and poultry raised on-site.

Additional artifacts collected during archeological investigations also provide some insight into conditions on the farm in the 19th and early 20th centuries. The variety of ceramic types and patterns collected throughout the site represent the variety of occupants through the years. Generally transient workers were likely to have fewer material possessions than their static landlords, as it would have been difficult to repeatedly move these belongings over time. It is also likely that full sets of each pattern or style of ceramic wares were not purchased, and ceramic pieces were instead acquired as needed. This would be for both economic and practical reasons and could also account for the variety of ceramic artifacts noted throughout the site.

Phase III archeological investigations also examined whether any activity areas were evident from the remains of the structure and whether any historic cultural materials could be linked to specific occupants. For example, most artifacts that appear to be associated with Grace Havens and her occupation as a seamstress were recovered from the northeastern corner of the original house footprint (Units 10 and 16, Trench 3) and the northwestern corner of the house addition (Unit 12). Three buttons were recovered elsewhere within the site. Two were recovered from Unit 13, which was situated near the suspected entrance of the house. The third was recovered from the stripped area near the original house foundation.

The remnants of children's toys, including bisque doll parts and an unglazed porcelain marble, were recovered from Units 13, 15, and 16 during Phase III archeological investigations. These toys generally dated to the late 19th century and may have belonged to Minnie Lisdell, Frank and Josephine Fero, or any number of other children who resided on site between available census records and were therefore not recorded in historical records.

Additionally, numerous materials dating c. 1920s-1930s were recovered throughout the site, but most were collected from the stripped area and the post-occupational fill within the original portion of the house foundation. These materials were deposited toward the end of the property's occupation and were likely linked to later occupants of the site including John P. Van Vechten, who owned the property between September of 1903 and December of 1929. Later landowners included a series of grantees who each held the property for a short time between 1931 and 1935 (Appendix 3).

Bisection of the well did not produce any significant cultural materials, suggesting that it remained in use during the occupation of the site. Materials dating to the 1920s-1940s were mainly concentrated within the foundation fill, the midden deposit identified during earlier archeological investigations, and near the ground surface around the foundation. The well was filled with field cobbles upon its abandonment.

8.1 Comparison of J. Houck Historic Site (OPRHP 05704.000188) to Houck Farmstead and Cemetery (OPRHP A05704.000119)

Several comparisons can be made between the Houck Farmstead and Cemetery (OPRHP A05704.000119 and A05704.000121) and the J. Houck Historic Site (OPRHP 05704.000188) based on archeological investigations and historical research conducted at both sites.

Historical research suggests that the J. Houck Historic Site was a rental property occupied by a series of tenant farmers, most working for the Houck family, who owned the residence and surrounding farmland. The lives

of tenants renting this property would certainly have differed compared to their Houck family landlords. Perhaps the biggest difference is the length of time a family may have taken up residence on the property.

Brothers Peter and Jacob Houck initially acquired the property in 1793, and the farmstead remained in the family through the death of a later Jacob Houck in 1905. Conversely, tenant farmers were generally somewhat transient and there was a lot of turnover of help on such farms. Tenant farmers frequently did not reside on the property for multiple generations as did their landlords, nor were they invested in the upkeep and improvement of the property as the landowners would be. Landowner homes were larger and more elaborate than those provided for tenant farmers; Jacob and Christina Houck's home was assessed as one of the most valuable properties in the Town of Florida in 1805 (Hartgen Archeological Associates 2008a).

Tenant farmers generally did not own a lot of personal items, as frequent moves would make these difficult to maintain and transport. On the other hand, it is likely that the Houck family amassed many more personal items and some luxury goods through the years and passed some of these items from generation to generation. The original Jacob Houck's will, dated 1839, describes some of the goods he intended to leave to his wife Christina and their children, including "all my furniture in the dwelling house where I reside including silver plate" in addition to stoves, beds, and bedding. Houck also left "all my farming utensils, one pleasure sleigh and the pleasure two horse carriage" to his son Isaac. Furthermore, Houck also divided additional property holdings, beyond the Houck farmstead in the Town of Glen, between his immediate family members. Conversely, it appears that many of the Houck family's tenants never owned their own property at all.

Some cultural materials recovered from the Jacob and Christina Houck house were like those recovered from the J. Houck Historic Site, and included whiteware, yellowware, hard-paste porcelain, and stoneware. Food remains, including faunal bone, were also recovered. No analysis of these remains was undertaken (Hartgen 2008).

Other cultural materials included a silver-plated spoon, ball clay-white tobacco pipe fragments, vessel glass. Many ceramics, including creamware and yellowware, hard-paste porcelain, lead-glazed redware, decorated and undecorated whiteware, and stoneware dated to the 19th century. A variety of whiteware was collected, with decoration including black underglaze transfer print, polychrome dipped/annular ware, polychrome banded, polychrome marbleized, blue dipped/annular ware, in addition to undecorated whiteware. These were popular between 1820 and 1900 (Hartgen 2002). Fragments of ball clay-white tobacco pipes, cut nails, and unidentified hardware were also collected. All these materials were recovered in front of the main farmhouse. More modern materials, including rubber tires and construction debris, were also noted, and gravestones related to the Houck family cemetery were observed nearby.

9 Synthesis and Conclusions

The Houck family were important in the settlement and early development of the community of Florida, New York, first recorded as purchasing the property in 1793. The Houck family owned and farmed their property for over 100 years, relying on additional labor from tenant farmers for much of this time. Previous archeology conducted at the Houck Farmstead and Cemetery (OPRHP A05704.000119) and several other contemporary tenant farmsteads allowed for some interesting regional comparisons.

The J. Houck Historic Site is the second of two tenant farmhouses on the property. The first is situated near the main house, while the J. Houck Historic Site is located southwest of the main farmhouse. The J. Houck Historic Site consists of three main features, the original stone cellar footprint, an L-shaped addition to the east, and a stone well that is likely contemporary to the original stone cellar.

In general, tableware and other goods recovered from the site, in addition to food remains were of low to moderate economic value. Faunal analysis indicated that occupants consumed a varied diet of cow and veal, pig, sheep, various birds, fish, and clams, likely supplemented with the variety of crops produced on the farm, including fruits from a small orchard. The economic values of various cuts of meat studied during this survey ranged from low to high, but generally fell within the moderate range.

Historic cultural materials recovered from the site, in conjunction with numerous historical records about the Houck family and their various tenant occupants, provide valuable information and insight into the lives of rural tenant farmers and their landlords in the region throughout the 19th century. Archeological and historical research conducted for the J. Houck Historic Site provided answers to some of the research questions formulated after Phase II archeological investigations.

Phase III archeological excavations successfully reached the floor of the cellar hole, the base of the original structure. These additional excavations identified an activity area associated with the seamstress Grace Havens, which was concentrated in the northeastern corner of the original house footprint. Additionally, excavations confirmed the location of a kitchen area on the west side of the original house footprint near the previously identified brick fireplace back. Additional units and a large stripping area excavated around the perimeter of the original house footprint and its later addition did not identify any further expansion to the structure. Stripping did not identify any additional features associated with the tenant house, including a privy or evidence of the second structure (likely a barn) shown on the 1905 Century map.

Excavation of Trench 1, which bisected the stone well, successfully removed the field cobbles filling the feature and reached the bottom of the feature approximately nine feet below the ground surface. No significant cultural materials were identified within the well.

Historic cultural materials and additional historic research did shed some light on the lives of the tenant farmers that occupied the J. Houck Historic Site. Conditions on the farm appeared to be relatively favorable, as faunal analysis indicated that residents consumed a varied diet, enjoyed coffee and other such goods, utilized a variety of ceramic styles and patterns, and had access to pharmaceuticals and, toward the end of the property's occupancy, cosmetics. In general, tableware and other goods recovered from the site, in addition to food remains were of low to moderate economic value. Faunal analysis indicated that occupants consumed a varied diet of cow and veal, pig, sheep, various birds, fish, and clams, likely supplemented with the variety of crops produced on the farm, including fruits from a small orchard. The economic values of various cuts of meat studied during this survey ranged from low to high, but generally fell within the moderate range.

Perhaps the longest tenant farmer resident, African American tenant farmer Benjamin Havens resided on site for over 17 years. In contrast to their Houck family landlords, however, tenant farmers tended to be transient. Alternatively, the Houck family owned and farmed the land for over 100 years.

The Houck family is shown to have owned slaves as of the 1820 census (United States Census Bureau 1820). However, they continued to rely on labor provided by free African Americans long after that date. Historical research revealed that several of these tenant farmers were African Americans living in the decades immediately following manumission of enslaved individuals in New York State. Unfortunately, there are currently no records of the Houck family to shed light on the agreements made with non-family members. Therefore, we can only speculate on the situation based on the larger historical context in which non-family laborers were associated with the Houck farm.

Benjamin and Grace Havens were both employed in different capacities throughout the years, according to historical records, with Benjamin working as a farmhand for many years and Grace as a seamstress. The couple eventually moved northeast to Amsterdam, occupying three recorded apartments over several years, but did not appear to purchase their own property. In addition to Benjamin and Grace Havens, several other free African Americans worked the Houck farm through the 19th century. One man, James Dennis, resided on the property as a teenager before fighting in the Civil War, successfully returning home, and becoming a prominent and well-respected citizen of Amsterdam. Historical records indicate, however, that Dennis remained poor, as his obituary in the *Amsterdam Evening Recorder* noted that he "performed humble tasks for a living" and "never possessed much of this world's goods." John Miller, another African American laborer, resided on the property around 1860. He was able to acquire property of his own sometime after his move from the Houck farm, which was described as "Lot 20 N.W. ¼ 40 [acres?] in Township 12, Old Military Tract" (Montgomery County Historian). He later relocated to Canajoharie with his second wife Maria where he resided until his death in 1887 at the age of 90.

There was a distinct rise in the number of tenant farms through the end of the 19th century. Throughout New York, merchants were purchasing struggling farms in outlying towns and leasing the land to tenant farmers (Summerhill 2008). However, farms in this region such as the Houck farm and Jones farm remained in the families for generations. The Houck farmstead relied on labor from tenant farmers between at least 1860 and 1900, according to available census records with an eventual decline toward the beginning of the 20th century. The Houck family lacked the means to hire the many laborers required to farm the 200 acres. As a result, they were likely happy with the modest income they could raise on idle land utilized by tenants. Throughout the 19th century, tenant farmers were critically important to the overall agricultural economy, especially for more modestly sized farms such as the Houcks'.

Expansion to the tenant farmhouse at the J. Houck Historic Site indicates that, even with an additional tenant house near the main farmhouse, more space was needed for the tenant farmers on the property and resources were available to provide a more comfortable living space for these workers. Later landowner John P. Van Vechten purchased the farm after the Houcks in 1903 and held the property through 1929. However, it appears that he never lived on the property. The census records from 1905 through 1920 record him as living in Esperance during those years. He may have continued to rent the tenant house at the J. Houck Historic Site, as was the trend with many other landlords around this time, which would account for much of the later refuse recovered from the site. After the analysis of historical maps, it has been determined that the house which used to be situated at the J. Houck Historic site was demolished between 1905 and 1931 (Century Map Company 1905; USGS 1931).

9.1 Public Education and Dissemination of Data

Hartgen will take the following steps to disseminate the results of the Phase III data retrieval study to the public:

- Distribute full-color hard copies and electronic copies of the final Phase III report to the Montgomery County Historical Society and one local library to ensure long-term accessibility of the information to the local community.
- Create a J. Houck Historic Site archeology resource in the Digital Archaeological Record (tDAR), an international digital repository for the digital records of archaeological investigations. tDAR's use, development, and maintenance are governed by Digital Antiquity, an organization dedicated to ensuring the long-term preservation of irreplaceable archaeological data and to broadening the access to these data.

Photographs

Photo 1. Archeologists excavate Units 12 and 13 near the Houck house foundation. Unit 10 is visible in the foreground. View looking southeast.

Photo 2. Unit 10 was excavated in the northeastern corner of the foundation. The stratigraphy visible in this unit was fairly consistent throughout the interior of the foundation. View looking northwest.

Photo 3. The stratigraphy east of the foundation, within the northern portion of the addition, consisted of a thin layer of topsoil atop redeposited field cobbles. The soils beneath the cobbles consisted of a very dark grayish brown silty loam underlain by a light olive brown silty loam subsoil. No living floor or substantial foundation remains were observed within the addition. View looking northwest.

Photo 4. Trench 1 was excavated to bisect the well, remove the cobble fill, and investigate any potential deposits within this feature. Although mechanical excavations were able to reach the base of the well, no significant cultural materials were recovered from the feature. View looking south.

Photo 5. Upon completion of the documentation, the well excavations (Trench 1) and Unit 11 were backfilled. View looking south.

Photo 6. Excavation of Trench 2, within the house addition. An intrusion into the topsoil consisting of cobbles amid darker soil, running generally in a north-south direction, indicated a possible exterior wall or edge of the addition. View looking north.

Photo 7. The north wall and a portion of the west wall were exposed after mechanical trenching. The depth of the foundation was relatively shallow and may have indicated the presence of a crawl space rather than a full cellar.

Photo 8. An archeologist inspects the stripping area west of the original house foundation. View looking north.

Appendix 2: Faunal Analysis

J. Houck Historic Site
Faunal Report
Marie-Lorraine Pipes PhD RPA

Introduction

Faunal remains were recovered from several area across the site. They were mainly composed of domesticated mammal and bird species (Table 1). There were however some remains that suggest intrusive wildlife including striped skunk and New England cottontail. Table 2 summarizes faunal remains by excavation unit, trench and general provenience. The general provenience refers to the stripping effort that was done north, northwest and west of the house foundation. It is evident that there is a difference in the composition of the units and trench as compared with the stripped area. The former yielded primarily mammal remains whereas the latter was more diversified by class and species and had a greater number of bird remains. In general, the deposits were composed of mainly of dietary refuse.

Methodology

The faunal assemblage was sorted by class, species, and size range category. For the purposes of this report, large mammal is equivalent in size to cattle and medium mammal to pig. Table 2 summarizes the deposits from the units, trenches and general provenience. Two counts are presented, the Total Number of Fragments (TNF) and the Minimum Number of Units (MNU). The TNF count serves as a curation tool indicating the absolute number of fragments for a given row of data. The MNU count is a reduced or adjusted count based on the number of actual skeletal elements represented for a row of data. Not all rows of data received an adjusted count (MNU) as its application was used only when one or more skeletal elements were identified. For example, a crushed pig femur consisting of 4 bone fragments would be tallied as 4 TNF, and would receive an adjusted count of 1 MNU, whereas 10 medium mammal indeterminate longbone fragments would be tallied as 10 TNF, 0 MNU. Within the database, the Minimum Number of Units column is modified by another variable, the MNU Type which indicates the type of unit quantified. Most of the discussion and tables in this report are based on MNElement, MNmeat Cut, and MNTeeth counts. In addition, there are two columns that indicated the type of meat unit and meat cut were represented by specimens. All specimens were weighed in grams.

Each bone specimen was further identified by skeletal element, portion, and age at death, when possible. All apparent bone modifications were recorded. The term ‘bone modification’ means the physical alteration of the original appearance of a skeletal element either by human, animal, or environmental agents. Bone modifications identified in the assemblage included butcher marks, gnaw marks, heat exposure, and weathering. In the report, discussions of bone modifications were based on the Total Number of bone Fragments (TNF). The terms used to group bone by refuse type within deposits included ‘Dietary Refuse’ and ‘Processing Waste’. Dietary refuse refers to meat bearing elements. Processing waste refers to cranial and foot elements which used for soups or stews, or discarded during organ extractions, such as the removal of brains and tongue. Meat cut illustrations are in the Access database under Reports.

Identifications were made with the aid of a comparative skeletal type collection and the use of references including but not limited to: Brown and Gustafson (1979), Cornwall (1956), Gilbert et al (1996), Merritt (1987), Olsen (1964), Reitz and Wing (1999), Schmid (1972), Sullivan and Hilbert (2014), and Ubaldi and Grossman (1987). Each row of data was bagged separately, assigned a specimen number composed of the bag, item, sub-item, and specimen numbers, e.g. 79.2.2.1, 79.2.2.2, 79.2.2.3 etc., and returned to its original provenience bag.

Summary of Deposits

The faunal remains are summarized by species rather than by location because of the low density of deposits. The three most abundant species were cattle, pig and chicken, all three of which are domesticates (Table 2). Cattle was recovered in some of the units, trenches, and general proveniences. It was composed of a wide range of meat cuts (Table 3). There was a selection of roasts, steaks, and stews, as well as a small number of processed cuts. There was also a range in terms of the economic value of the cuts including high, medium, and low. Most cuts fell in the medium to low value range and were dominated by larger units of meat. There was only 1 veal cut which consisted of a leg roast. Pig was recovered from fewer deposits at the site, mainly from units. Cuts were limited in terms of variety of meats and cut types (table 4). There was one chop, one ham, three stew meats and a processed cut. Most of the cuts were of low economic value. Most pig elements came from subadults and juveniles. However, one phalange came from an adult individual. Other mammal species included sheep, cottontail, skunk, and woodchuck. Each of these species were found in singular deposits at the site and represented by few skeletal elements. Sheep consisted of three meat cuts, all of which were loin-end chops. The other three species were most likely intrusive in the deposits and probably not consumed. None of their skeletal elements were modified in any way. Cattle, pig and sheep meat cuts exhibited saw, cleaver and chop marks.

Identified birds included chicken, duck and goose (Table 2). In addition, there was a small unidentified bird indicated. The distribution of birds was limited to primarily to the general proveniences, namely Bags 112 and 114. In Bag 112 body parts included the neck, wing, breast and leg of two individuals, and in Bag 114, they included the leg and wing of one individual. One femur fragment contains medullary bone which is produced in females when they are laying eggs. Another leg was indicated in Bag number 105. Duck was limited to Unit 12 and was represented by a wing. Goose was recovered in Bag 114 and was represented by a wing and leg. Bag 112 yielded the toe bones of a large unidentified bird. One of the phalanges had a pathology, excessive bone growth. Large bird skeletal elements were also present in Unit 10 and Trench 3. All of the bird remains, with the exception of the small unidentified bird, represent food remains.

In addition to mammals and birds, there was a small amount of unidentified fish. Fish skeletal remains consisted mainly of fragmentary cranial plates and a few vertebrae, all of which were found in Bag 112.

In addition to butcher marks found on meat cuts, bone modifications include low frequencies of gnaw marks, heat exposure and weathering. Rodent incisor marks and canine

gnaw marks, perhaps from dogs, were seen occasionally. Very few specimens were calcined or charred. The same was true of weathering which included staining on the surface of the bone and flaking of the cortex.

Conclusion

The assemblage represents dietary refuse. A few cranial elements indicate heads and mandibles were processed for tongue, brain, and facial tissue used for making cold cuts like headcheese. The overall range of meats and cut types, as well as the presence of different fowl and fish, indicate a varied diet. Because medullary bone was found in at least one individual, it is evident that birds were raised on site.

EXECUTIVE SUMMARY

Bluewater Property Group has retained Langan to prepare a traffic impact study for a proposed warehouse development. The building, upon completion, will provide a 652,060 square foot (sf) footprint warehouse supported by 415 trailer parking spaces, 990 car parking spaces, and 59 loading docks. The project site is located in the Town of Florida, Montgomery County, New York.

The site is located along eastbound New York State Route 5S (NYS Route 5S) and bound by NYS Route 5S to the north, Mead Road to the east, the New York State Thruway (Interstate 90) to the south, and an existing warehouse development to the west.

Site access is proposed via three driveway locations along NYS Route 5S. The primary access is the central driveway, proposed to intersect NYS Route 5S opposite Target Drive East, and is intended to be utilized by passenger cars only. The central driveway will be full-movement and signalized to improve operational delays. We prepared a traffic signal warrant analysis of the NYS Route 5S and Target Driveway East intersection under future traffic conditions and the traffic volume-based warrant analysis indicates that Warrant 3 (Peak Hour) is met as a result of delay, thus supporting the proposed installation of a traffic signal. The second access, western driveway, is a stop-controlled full-movement intersection that will be utilized by trucks only. The third access, eastern driveway, will primarily be utilized by passenger cars with the exception of limited seasonal peak periods when outbound site trucks could egress the site at this location. The eastern driveway will be a stop-controlled right-in/right-out only access.

Langan recommends that three access points are necessary for the following reasons:

- The primary objective of the site access is to minimize interaction between passenger car and truck traffic within the site circulation.
    - Separate access to the truck court is established. Based on the layout of the truck court, the western driveway location allows the ability to provide appropriate stacking in advance of the guardhouse in addition to providing the necessary trailer parking spaces to support typical operations.
- The site has significant frontage along NYS Route 5S (approximately 4,000 feet).
- Site constraints, including existing easements, wetland disturbance, and grade conditions limit the location of access points and internal circulation connections.
- Due to site constraints, the layout of the employee parking area results in the necessity of two access points, one on each end of the parking fields.
- Reduce impacts to the NYS Route 5S corridor and adjacent properties by providing

efficient access and appropriate on-site circulation.

For this traffic study, we are analyzing roadway volumes under two conditions, including the "Roadway Peak Hour Condition" and "Generator Peak Hour Condition". For the "Roadway Peak Hour Condition", the weekday morning peak hour of the adjacent roadway system occurs from 7:30 AM to 8:30 AM and the weekday evening peak of the adjacent roadway system occurs from 3:30 PM to 4:30 PM. The "Generator Peak Hour Condition" was analyzed based on peak employee arrivals and departures specific to typical daily operations. The proposed warehouse will operate 24 hours a day, with two general shifts for employees. The peak employee arrival and departure periods are anticipated to occur from 6:30 AM to 7:30 AM and from 5:30 PM to 6:30 PM.

We estimated the number of new trips the proposed warehouse would generate based on tenant specific data summarized below:

- Roadway Peak Hour Condition: 157 trips (118 enter, 39 exit) during the weekday morning peak hour of the roadway and 139 trips (54 enter, 85 exit) during the weekday evening peak hour of the roadway.
- Generator Peak Hour Condition: 630 trips (560 enter, 70 exit) during the weekday morning peak hour and 1,005 trips (461 enter, 544 exit) during the weekday evening peak hour.

We determined the directional distribution of the site-generated trips for the warehouse based on an examination of demographic data, existing and expected travel patterns in the study area, and a census journey-to-work model.

We conducted capacity analyses at the following intersections:

- NYS Route 5S and NYS Route 30 Southbound Ramps / P.S. Street
- NYS Route 5S and NYS Route 30 Northbound Ramps
- NYS Route 30 and NYS Route 5S Ramps
- NYS Route 30 and New York State Thruway (Interstate 90 – Exit 27) Ramps
- NYS Route 5S and Target Driveway East / Proposed Central Driveway
- NYS Route 5S and Proposed West Driveway
- NYS Route 5S and Proposed East Driveway

Based on a review of the analyses, with the improvements as discussed herein, we determined that the adjacent roadway network and proposed driveway system have the capacity to accommodate the anticipated traffic generated by typical operation of the proposed warehouse.

Moreover, with the proposed improvements, discussed below, the development will not create any significant adverse impacts to traffic operations in the study area during peak hours.

We recommend the following improvements associated with the access to the site:

- NYS Route 5S and Target Driveway East/Central Driveway
    - Widen NYS Route 5S to provide an exclusive westbound left-turn lane with approximately 400 feet of storage.
    - Signalize the intersection.
- NYS Route 5S and West Driveway (truck access only)
    - Within the existing median provide an exclusive westbound left-turn lane with approximately 200 feet of storage.

The design of the driveways and associated improvements will be in accordance with the NYSDOT (New York State Department of Transportation) design standards.

INTRODUCTION

Bluewater Property Group has retained Langan to prepare a traffic impact study for a proposed warehouse development. The building, upon completion, will provide a 652,060 square foot (sf) footprint warehouse supported by 415 trailer parking spaces, 990 car parking spaces, and 59 loading docks. The project is located in the Town of Florida, Montgomery County, New York.

Project Description

The project site consists of a warehouse building with a 652,060 square foot (sf) footprint. The total building square footage, inclusive of all floors and mezzanines, which is primarily dedicated to automated robotics sortation and material handling systems, is approximately 3,232,740 sf. As a result, traffic generation for the site is more accurately represented based on tenant-specific employee projected operations and is not related to the overall square footage.

The parcel is identified as Section 54, Block 1, and Lot 36 according to Montgomery County Tax Maps. The site location is shown in Figure 1. The site is located along eastbound New York State Route 5S (NYS Route 5S) and bound by NYS Route 5S to the north, Mead Road to the east, the New York State Thruway (Interstate 90) to the south, and an existing warehouse development to the west.

Site access is proposed via three driveway locations along NYS Route 5S. The primary access is the central driveway, proposed to intersect NYS Route 5S opposite Target Drive East, and is intended to be utilized by passenger cars only. The central driveway will be full-movement and signalized to improve operational delays. We prepared a traffic signal warrant analysis of the NYS Route 5S and Target Driveway East intersection under future traffic conditions and the traffic volume-based warrant analysis indicates that Warrant 3 (Peak Hour) is met as a result of delay, thus supporting the proposed installation of a traffic signal. The second access, western driveway, is a stop-controlled full-movement intersection that will be utilized by trucks only. The third access, eastern driveway, will primarily be utilized by passenger cars with the exception of limited seasonal peak periods when outbound site trucks could egress the site at this location. The eastern driveway will be a stop-controlled right-in/right-out only access.

Langan recommends that three access points are necessary for the following reasons:

- The primary objective of the site access is to minimize interaction between passenger car and truck traffic within the site circulation.
    - Separate access to the truck court is established. Based on the layout of the truck court, the western driveway location allows the ability to provide appropriate

stacking in advance of the guardhouse in addition to providing the necessary trailer parking spaces to support typical operations.

- The site has significant frontage along NYS Route 5S (approximately 4,000 feet).
- Site constraints, including existing easements, wetland disturbance, and grade conditions limit the location of access points and internal circulation connections.
- Due to site constraints, the layout of the employee parking area results in the necessity of two access points, one on each end of the parking fields.
- Reduce impacts to the NYS Route 5S corridor and adjacent properties by providing efficient access and appropriate on-site circulation.

Study Area

We conducted capacity analyses at the following intersections:

- NYS Route 5S and NYS Route 30 Southbound Ramps / P.S. Street
- NYS Route 5S and NYS Route 30 Northbound Ramps
- NYS Route 30 and NYS Route 5S Ramps
- NYS Route 30 and Interstate 90 Ramps
- NYS Route 5S and Target Driveway East / Central Driveway
- NYS Route 5S and West Driveway
- NYS Route 5S and East Driveway

An inventory of the physical road conditions is presented in the section "Description of Existing Conditions."

Scope of Study

Langan undertook the following steps to prepare this study in accordance with standard accepted methodologies:

1. Conducted a desktop examination of the site and surrounding road network to inventory physical and regulatory conditions including the number of lanes, lane assignments, channelization, traffic-control devices, lateral clearances, and other factors that limit traffic capacity.
2. Conducted a series of turning movement traffic counts (TMCs) at the study intersections identified in the previous section. We conducted counts on a typical weekday from 5:00 AM to 9:00 AM and from 3:00 PM to 7:00 PM. In addition, we conducted Automatic Traffic Recorder (ATR) counts on both sides of NYS Route 5S along the site's frontage. We then identified existing weekday morning and evening peak hour traffic volumes based on the traffic count data for both analysis conditions.
3. Established 2025 existing traffic volumes using the conducted turning movement traffic counts. Note that both the peak hours of the adjacent roadway system and tenant specific peak hours were established.
4. Established future 2027 No-Build traffic volumes by conservatively applying a growth factor of 1.8% to the 2025 existing traffic volumes. This growth factor is based on New York State Department of Transportation (NYSDOT) historical data and a review of previous traffic studies conducted in the area.
5. Prepared trip generation estimates for the proposed warehouse based on tenant specific data.
6. Developed trip distribution for the site based on an examination of demographic data, existing and expected travel patterns in the study area, and a census journey-to-work model.
7. Assigned site-generated trips to the access driveways and surrounding road network based on the likely travel routes motorists will use to travel to and from the site.
8. Established future 2027 Build traffic volumes by adding future anticipated tenant specific site-generated trips to 2027 No-Build traffic volumes.
9. Performed intersection capacity analyses for the weekday morning and evening peak hours using Synchro Software.

DESCRIPTION OF EXISTING CONDITIONS

This section describes the roads, intersections, and traffic volumes in the area of the development located in the Town of Florida, Montgomery County, New York.

Roads

Interstate 90 (I-90)

I-90 is classified as an urban principal arterial interstate (11) and is under New York State Department of Transportation (NYSDOT) jurisdiction. The roadway has a general east-west orientation. The eastbound and westbound ramps at Exit 27 connect to NYS Route 30.

New York State Route 5S (NYS Route 5S)

NYS Route 52 is classified as urban minor arterial (16) and is under NYSDOT jurisdiction. The roadway has a general east-west orientation and generally provides one travel lane in each direction. The posted speed limit varies between 45mph and 55mph in the study area.

New York State Route 30 (NYS Route 30)

NYS Route 30 is classified as an urban principal arterial (14) and is under NYSDOT jurisdiction. The roadway has a general north-south orientation and generally provides two travel lanes in each direction. The posted speed limit is 55mph in the study area.

P.S. Street

P.S. Street is classified as an urban local (19) road and is under municipal jurisdiction. The roadway has a general north-south orientation and provides one travel lane in each direction. There is no posted speed limit.

Intersections

NYS Route 5S and NYS Route 30 Southbound Ramps / P.S. Street

The NYS Route 30 southbound ramps and P.S. Street intersect NYS Route 5S to form the south and north legs, respectively, of a four-leg intersection under signal control. The eastbound NYS Route 5S approach provides one shared left-turn/thru lane and one exclusive right-turn lane. The westbound NYS Route 5S approach provides one shared left-turn/thru/right-turn lane. The northbound NYS Route 30 exit ramp provides one shared left-turn/thru/channelized right-turn lane. The channelized right-turn movement is under stop control. The southbound P.S. Street approach provides one shared left-turn/thru/right-turn lane. The signal operates under four phases with a 70 second cycle length during the analyzed time periods.

NYS Route 5S and NYS Route 30 Northbound Ramps

The NYS Route 30 northbound ramps intersect NYS Route 5S to form the south and north legs of a four-leg intersection under signal control. The eastbound NYS Route 5S approach provides one shared left-turn/thru lane. The westbound NYS Route 5S approach provides one shared thru/free flow channelized right-turn lane. The northbound NYS Route 30 exit ramp provides one shared left-turn/thru/right-turn lane. The southbound NYS Route 30 entrance ramp provides one receiving lane. The signal operates under two phases with a 45 second cycle length during the analyzed time periods.

NYS Route 30 and NYS Route 5S Ramps

The NYS Route 5S ramps intersect NYS Route 30 to form the east and west legs of a four-leg intersection under signal control. The eastbound NYS Route 5S ramp approach provides one right-turn lane. The westbound NYS Route 5S ramp provides one receiving lane for the NYS Route 30 northbound right-turn. The northbound NYS Route 30 approach provides one exclusive thru lane and one shared thru/right-turn lane. The southbound NYS Route 30 approach provides one exclusive thru lane and one shared thru/channelized free flow right-turn lane. The signal operates under four phases as part of the adjacent signal to the south for the I-90 ramps (Exit 27). The signal system operates with a 100 second cycle length during the analyzed time periods.

NYS Route 30 and I-90 Ramps / Gas Station Driveway

The I-90 ramps (Exit 27) and the Exxon driveway intersect NYS Route 30 to form the east and west legs, respectively, of a four-leg intersection under signal control. The eastbound Exxon driveway approach provides one shared left-turn/thru/right-turn lane. The westbound I-90 ramp approach provides one shared left-turn/thru lane and two channelized right-turn lanes. The northbound NYS Route approach provides one left-turn lane, one exclusive thru lane, and one shared thru/channelized right-turn lane. The southbound approach provides one left-turn lane and one shared thru/right-turn lane. The signal operates under four phases as part of the adjacent signal to the north for the NYS Route 5S ramps. The signal system operates with a 100 second cycle length during the analyzed time periods.

NYS Route 5S and Target Drive East

Target Drive East intersects NYS Route 5S to form the north leg of a T-shaped intersection under stop control. The eastbound NYS Route 5S approach provides one left-turn lane and one thru. The westbound NYS Route 5S approach provides one thru lane, and one right-turn lane. The southbound Target Drive East approach provides one left-turn lane and one right-turn lane.

Traffic Volumes

To examine traffic conditions near the site, turning movement traffic counts (TMC) were arranged for the morning and evening peak hours on a typical weekday at the study intersections. Specifically, turning movement counts were conducted on Wednesday, 5 February 2025 from 5:00 AM to 9:00 AM and from 3:00 PM to 7:00 PM.

Additionally, Automatic Traffic Recorders (ATR) were placed to collect data between Thursday, February 27, 2025 and Tuesday, March 4, 2025. ATRs were placed on both the eastbound and westbound sides of NYS Route 5S along the site's frontage between Target Drive East and Broadway Extended.

The traffic counts identify distinct times during the weekday morning and evening periods when traffic experienced its highest levels. Based on the turning movement counts (TMCs), the weekday morning peak hour of the adjacent roadway system occurs between 7:30 AM and 8:30 AM and the weekday evening peak hour of the adjacent roadway system occurs between 3:30 PM and 4:30 PM.

Note that both the peak hours of the adjacent roadway system and the tenant specific peak hours were analyzed. Those peak hours fall under two conditions "Roadway (adjacent street) Peak Hour Condition" and "Generator (tenant specific) Peak Hour Condition". For the "Roadway Peak Hour Condition", as discussed above, the weekday morning peak hour of the adjacent roadway system occurs from 7:30 AM to 8:30 AM and the weekday evening peak of the adjacent roadway system occurs from 3:30 PM to 4:30 PM. Whereas, the "Generator Peak Hour Condition" is based on peak employee arrivals and departures specific to the site's typical daily operations. The proposed warehouse will operate 24 hours a day, with two general shifts for employees. In general, it is anticipated that the peak employee arrival and departure periods will occur from 6:30 AM to 7:30 AM and from 5:30 PM to 6:30 PM.

Figure 2 illustrates the existing weekday morning and evening peak hour traffic volumes. Summaries of the traffic counts and ATRs are contained in Appendix B.

ESTIMATE OF FUTURE CONDITIONS

This section of the report covers background traffic growth, site-generated trips, trip distribution, and future traffic volumes. We anticipate the project will be completed by the end of 2027. Accordingly, we projected traffic volumes to include existing traffic and new traffic created by background growth to derive the 2027 No-Build traffic volumes. The site-generated trips were added to the 2027 No-Build traffic volumes to derive the 2027 Build traffic volumes.

Background Traffic Growth

We increased the 2025 Existing traffic volumes by compounded annual growth rate of 1.8 percent. The growth rate is consistent with other area studies that are based on information from NYSDOT including historical traffic data. Figure 3 illustrates the 2027 No-Build traffic volumes.

Site-Generated Trips

The proposed 652,060 sf (footprint) warehouse building will have the following typical 24-hour operations:

- The day shift workers generally begin a 10.5 hour shift at 7 AM and work until 5:30 PM.
- The night shift workers generally begin a 10.5 hour shift at 6 PM and work until 4:30 AM.
- Based on the shift times, the facility generator peak employee arrival and departure periods will occur from 6:30 AM to 7:30 AM and from 5:30 PM to 6:30 PM. The facility generator peak does not coincide directly with the commuter (adjacent roadway) peak periods, which are from 7:30 AM to 8:30 AM and from 3:30 PM to 4:30 PM.

We prepared trip generation estimate for the proposed warehouse development using tenant specific data. The trip generation data is included in Appendix C.

We utilized data published by the U.S. Census Bureau to estimate the level of carpool utilization for the Town of Florida in Montgomery County. The census data indicates that approximately 10% carpool to their place of employment. Therefore, the trip generation accounts for a factor of 10% carpool use. Appendix D contains the census data.

Table 1 summarizes the trip generation estimate for the weekday morning and evening peak hours.

Table 1 – Future Trip Generation Estimates

Vehicle Type	Peak Hour of Roadway Condition						Peak Hour of Generator Condition					
	AM Peak Hour			PM Peak Hour			AM Peak Hour			PM Peak Hour		
	7:30 AM – 8:30 AM			3:30 PM – 4:30 PM			6:30 AM – 7:30 AM			5:30 PM – 6:30 PM		
	In	Out	Total	In	Out	Total	In	Out	Total	In	Out	Total
Cars	108	30	138	40	73	113	551	63	614	451	531	982
Trucks	10	9	19	14	12	26	9	7	16	10	13	23
TOTAL	**118**	**39**	**157**	**54**	**85**	**139**	**560**	**70**	**630**	**461**	**544**	**1,005**

Trip Distribution

We determined the directional distribution of site-generated trips based on demographic data, existing travel patterns in the study area, and a census journey-to-work model. We reviewed census data to develop a journey-to-work model and create distributions that are representative of the employment draw for the proposed warehouse.

Site access is proposed via three driveway locations along NYS Route 5S. The primary access is the central driveway, proposed to intersect NYS Route 5S opposite Target Drive East, and is intended to be utilized by passenger cars only. The second access, western driveway, will be utilized by trucks only. The third access, eastern driveway, will primarily be utilized by passenger cars with the exception of limited seasonal peak periods when outbound site trucks could egress the site at this location. The eastern driveway will be a right-in/right-out only access.

Table 2 shows the arrival and departure distributions. The journey-to-work model is included in Appendix D.

Table 2 – Arrival and Departure Trip Distributions

Direction (To/From)	Passenger Cars		Trucks
	Arrival	Departure	Arrival / Departure
NYS Route 5S (East)	5%	5%	-
NYS Route 5S (West) Including I-90 – Exit 28 (West) NYS Route 5S (West) Main Street (North) Other local roads	23%	23%	20%
NYS Route 30 North	22%	22%	-
NYS Route 30 South	9%	9%	-
I-90 Ramps – Exit 27 (East)	41%	41%	80%
Total	**100%**	**100%**	**100%**

The site-generated traffic was then applied to the adjacent roadway system as per the above distributions. Figures 4 and 5 show the arrival and departure distributions for the passenger cars and trucks, respectively. The site-generated trips are shown on Figure 6 for the passenger cars and on Figure 7 for the trucks. The total site-generated trips assigned to the roadway network for the proposed warehouse are shown on Figure 8.

Build Traffic Volumes

The 2027 Build traffic volumes were derived by adding the total proposed site-generated trips, Figure 8, to the 2027 No-Build traffic volumes, Figure 3. Figure 9 illustrates the 2027 Build weekday morning and evening peak hour traffic volumes for both the "Roadway (adjacent street) Peak Hour Condition" and the "Generator (tenant specific) Peak Hour Condition".

ANALYSIS OF TRAFFIC OPERATIONS

This section describes the capacity analysis we conducted to assess traffic operations for the No-Build and Build conditions. Capacity analysis provides an indication of the adequacy of road facilities to serve traffic demand.

Level of Service Criteria

Level of Service (LOS) is the term used to denote different operating conditions that occur on a given road segment under various traffic-volume demands. LOS is a qualitative measure that considers a number of factors including road geometry, speed, travel delay and freedom to maneuver. LOS designations range from A to F and provide an index of operational qualities of a road segment or an intersection. LOS A represents the best operating conditions; LOS F represents the worst.

LOS designations are reported differently for signalized and unsignalized intersections. For signalized intersections, the analysis considers the operation of all traffic entering the intersection. For unsignalized intersections, the analysis considers the operation of all movements that conflict with other movements, such as main-line left turns and traffic exiting a side street. The evaluation criteria used to analyze the study area intersections are based on the Highway Capacity Manual, (HCM), published by the Transportation Research Board and the Synchro software.

The HCM defines LOS for signalized intersections as follows:

LOS	Control Delay per Vehicle
A	≤10 sec
B	>10 and ≤20 sec
C	>20 and ≤35 sec
D	>35 and ≤55 sec
E	>55 and ≤80 sec
F	>80 sec

The HCM defines LOS for unsignalized intersections as follows:

LOS	Delay Range (sec/veh)
A	≤10 sec
B	>10 and ≤15 sec
C	>15 and ≤25 sec
D	>25 and ≤35 sec
E	>35 and ≤50 sec
F	>50 sec

Capacity Analysis

We conducted analyses for the intersections in the study area and found that the adjacent roadway network has the capacity to accommodate the traffic associated with the proposed warehouse development. Table 3 summarizes the 2027 No-Build, Build, and Build with Improvements levels of service (LOS) at each relevant study intersection during the weekday morning and evening peak hours. Note that both the peak hours of the adjacent roadway system and the tenant specific peak hours were analyzed. Those peak hours fall under two conditions "Roadway (adjacent street) Peak Hour Condition" and "Generator (tenant specific) Peak Hour Condition". Following are discussions pertaining to each of the study intersections. Capacity analysis worksheets are contained in Appendix F. Appendix E contains the traffic signal timings and plans that were obtained from the NYSDOT and used in the analysis for this traffic study.

Table 3 – Intersection Capacity Analysis Summary

Intersection	Lane Use	Roadway Peak Hour Condition (7:30AM-8:30AM and 3:30PM-4:30PM)												Generator Peak Hour Condition (6:30AM-7:30AM and 5:30PM-6:30PM)

Based on Synchro and HCM Software [*Level of Service (Average vehicle delay (seconds per vehicle))]

NYS Route 5S and NYS Route 30 Southbound Ramps / P.S. Street

Roadway Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS B during the weekday morning peak hour and at an overall LOS C during the evening peak hour under the No-Build condition. Under the Build condition, the intersection is expected to operate at an overall LOS C during both the weekday morning and evening peak hours.

Generator Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS A during the weekday morning peak hour and at an overall LOS B during the evening peak hour under the No-Build condition. Under the Build condition, the intersection is expected to operate at an overall LOS B during both the weekday morning and evening peak hours.

NYS Route 5S and NYS Route 30 Northbound Ramps

Roadway Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS A during the weekday morning peak hour and at an overall LOS B during the evening peak hour under the No-Build condition. Under the Build condition, the intersection is expected to operate at an overall LOS A during the weekday morning peak hour and an overall LOS C during the weekday evening peak hour.

Generator Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS A during both the weekday morning and the evening peak hour under the No-Build condition. Under the Build condition, the intersection is expected to operate at an overall LOS B during the weekday morning peak hour and an overall LOS C during the weekday evening peak hour.

NYS Route 30 and NYS Route 5S Ramps

Roadway Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS A during both the weekday morning and evening peak hours under the No-Build condition. Under the Build condition, the intersection is expected to continue to operate at an overall LOS A during both the weekday morning and evening peak hours.

Generator Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS A during both the weekday morning and evening peak hours under the No-Build condition. Under the Build condition, the intersection is expected to continue to operate at an overall LOS A during both the weekday morning and evening peak hours.

NYS Route 30 and I-90 Ramps

Roadway Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS C during the weekday morning peak hour and at an overall LOS B during the evening peak hour under the No-Build condition. Under the Build condition, the intersection is expected to continue to operate at an overall LOS C during the weekday morning peak hour and at an overall LOS B during the evening peak hour.

Generator Peak Hour Condition

The signalized intersection is expected to operate at an overall LOS C during the weekday morning peak hour and at an overall LOS B during the evening peak hour under the No-Build condition. Under the Build condition, the intersection is expected to continue to operate at an overall LOS C during the weekday morning peak hour and at an overall LOS B during the evening peak hour.

NYS Route 5S and Target Driveway East / Central Driveway

Geometry – Proposed Condition

The proposed central driveway will intersect the existing T-shaped intersection to form the south leg and create a four-leg intersection. It is proposed to signalize the future intersection. The eastbound NYS Route 5S approach will provide one left-turn lane and one shared thru/right-turn lane. The westbound NYS Route 5S approach will provide one left-turn lane, one thru lane, and one right-turn lane. The northbound proposed central driveway approach will provide one left-turn lane and one shared thru/right-turn lane. The southbound Target Drive East approach will provide one left-turn lane and one shared thru/right-turn lane. We analyzed the intersection as both under stop-controlled (TWSC) and under signalization.

We recommend the following improvements associated with the Central Driveway intersection:

- NYS Route 5S and Target Driveway East / Central Driveway
    - Widen NYS Route 5S to provide an exclusive westbound left-turn lane with approximately 400 feet of storage.

- Signalize the intersection.

We have evaluated the feasibility of a roundabout at the location and due to both the development and potential adjacent development site constraints it is our opinion that the construction of a roundabout is not a viable alternative at this location.

Roadway Peak Hour Condition

All movements at the stop-controlled intersection are expected to operate at LOS C or better during both the weekday morning and evening peak hours under the No-Build condition. Under the Build condition with TWSC (Two-Way Stop-Control), all movements at the intersection are expected to operate at LOS D or better.

Under the Build with Improvements condition, the signalized intersection is expected to operate at an overall LOS A during the weekday morning peak hour and an overall LOS B during the weekday evening peak hour.

Generator Peak Hour Condition

All movements at the stop-controlled intersection are expected to operate at LOS B or better during both the weekday morning and evening peak hours under the No-Build condition. Under the Build condition, all movements are expected to operate at LOS B or better during both the weekday morning and evening peak hours, with the exception of the northbound and southbound left-turn movements, which are expected to operate at LOS F during both peak hours. Based on the anticipated poor operational delays in the Build condition we recommend signalizing the intersection to improve the traffic operations. The signal will help to reduce impacts to the NYS Route 5S corridor and adjacent properties by providing efficient access and appropriate on-site circulation.

Under the Build with Improvements condition, the signalized intersection is expected to operate at an overall LOS A during the weekday morning peak hour and an overall LOS B during the weekday evening peak hour.

Traffic Signal Warrant Analysis

We performed a traffic signal warrant analysis for the intersection using the Manual on Uniform Traffic Control Devices (MUTCD) Standards, 11th Edition. There are nine warrants described in the MUTCD. We only evaluated the traffic volume-based warrants.

We evaluated the 2027 Build volumes, under both roadway and generator peak hour conditions, from the analysis for the NYS Route 5S and Target Driveway East intersection, to determine if

they meet any of the traffic volume-based warrants. Appendix G contains the warrant summary report.

The traffic volume-based warrant analysis shows that Warrant 3 (Peak Hour) is met for Condition A. The peak hour that meets the criteria is from 5:30 PM to 6:30 PM (which is the evening generator shift change). The peak hour warrant (Warrant 3) is for considering the installation of a traffic signal when, for a minimum of 1 hour in a day, the side street experiences excessive delays when entering the intersection. Usually applied in unusual cases (i.e. office complexes, manufacturing plants, industrial complexes, or facilities that deal with large numbers of vehicles over a short period of time). It is Langan's opinion that the peak hour warrant (Warrant 3) is applicable for the proposed warehouse, an industrial use. The following Condition A requirements are met for Warrant 3, peak hour:

- Total stopped-time delay in the site driveway is 45.5 vehicle-hours (MUTCD's warrant criteria is >5 vehicle-hours);
- Total volume in the site driveway is 202 vehicles (MUTCD's warrant criteria is >150 vehicles);
- Total volume for the intersection is 985 vehicles (MUTCD's warrant criteria is >800 vehicles).

Based on the results of the traffic signal warrant analysis, we recommend signalizing the intersection under the proposed future conditions.

NYS Route 52 and West Driveway

Geometry

It is proposed to construct a full movement driveway on the west side of the site as the primary access for trucks. The proposed west driveway will intersect NYS Route 5S to form the south leg of a T-shaped intersection under stop control. The eastbound NYS Route 5S approach will provide one shared thru/right-turn lane. The westbound NYS Route 5S approach will provide one left-turn lane and one thru lane. The northbound proposed west driveway approach will provide one shared left-turn/right-turn lane that is stop control.

Based on the enclosed analysis, as part of the development, it is proposed to implement the below improvements.

- NYS Route 5S and West Driveway (for truck access only)
    - Within the existing median provide an exclusive westbound left-turn lane with approximately 200 feet of storage.

Roadway Peak Hour Condition

All movements at the unsignalized intersection are expected to operate at LOS B or better during both the weekday morning and evening peak hours under the Build condition.

Generator Peak Hour Condition

All movements at the unsignalized intersection are expected to operate at LOS B or better during both the weekday morning and evening peak hours under the Build condition.

Gap Analysis

As requested by NYSDOT, we conducted a gap analysis on NYS Route 5S to determine if sufficient gaps exist for the proposed west driveway as a stop-controlled truck access location. Specifically, we conducted a gap analysis at the existing NYS Route 5S and Target Driveway East intersection, which is the closest location to the proposed west driveway with similar conditions. We looked at a sampling of the traffic count videos collected on 5 February 2025. The existing roadway peak hours occurred between 7:30 AM to 8:30 AM and between 3:30 PM to 4:30 PM. We determined the peak 15-minute AM and PM periods that occurred during the commuter peak hours discussed above. For the AM peak period, we reviewed gaps from 8:15 AM to 8:30 AM and for the PM peak period, we reviewed gaps from 4:00 PM to 4:15 PM.

We utilized HCM (Highway Capacity Manual) methodology to adjust the critical headways and the follow-up headways to account for a 100 percent proportion of heavy vehicles for the available gap calculations. The results of the gap analysis, with adjustments for heavy vehicles, showed the following:

- A minimum of 444 total gaps from 7:30 AM to 8:30 AM (based on the sampling we took)
- A minimum of 160 total gaps from 3:30 PM to 4:30 PM (based on the sampling we took).
- Based on both build condition peak hour estimates, the above gaps are sufficient for the following egress volumes:
    - Roadway Peak Hour Condition:
        - AM Peak Hour: 9 total egress movements (2 left-turn and 7 right-turn)
        - PM Peak Hour: 12 total egress movements (2 left-turn and 10 right-turn)
    - Generator Peak Hour Condition:
        - AM Peak Hour: 7 total egress movements (1 left-turn and 6 right-turn)
        - PM Peak Hour: 13 total egress movements (3 left-turn and 10 right-turn)

The above gap analysis shows that the available gaps are significantly higher than the proposed truck volume anticipated to make a left-turn or right-turn out of the proposed west driveway. Therefore, we do not anticipate any major delays at the proposed west driveway for egress movements. The gap analysis is included in Appendix B.

NYS Route 5S and East Driveway

Geometry

The third access, eastern driveway, will primarily be utilized by passenger cars with the exception of limited seasonal peak periods when outbound site trucks could egress the site at this location. The eastern driveway will be a stop-controlled right-in/right-out only access. The eastbound NYS Route 5S approach will provide one shared thru/right-turn lane with channelization. The westbound NYS Route 5S approach will provide two thru lanes with left-turns restricted. The northbound proposed east driveway approach will provide one channelized right-turn lane under stop control.

Roadway Peak Hour Condition

All movements at the unsignalized intersection are expected to operate at LOS B or better during both the weekday morning and evening peak hours under the Build condition.

Generator Peak Hour Condition

All movements at the unsignalized intersection are expected to operate at LOS B or better during both the weekday morning and evening peak hours under the Build condition.

CRASH DATA ANALYSIS

As requested by NYSDOT, we obtained crash data from the Department for the general area on NYS Route 5S and NYS Route 30 between the years 2021 and 2024. The data summarizes the total number of reportable crashes (including property damage, injury, or fatalities) that occurred during the captured period. Exhibit 1 below shows a graphic summary of the crash information provided by NYSDOT. The raw crash data obtained from NYSDOT is included in Appendix H.

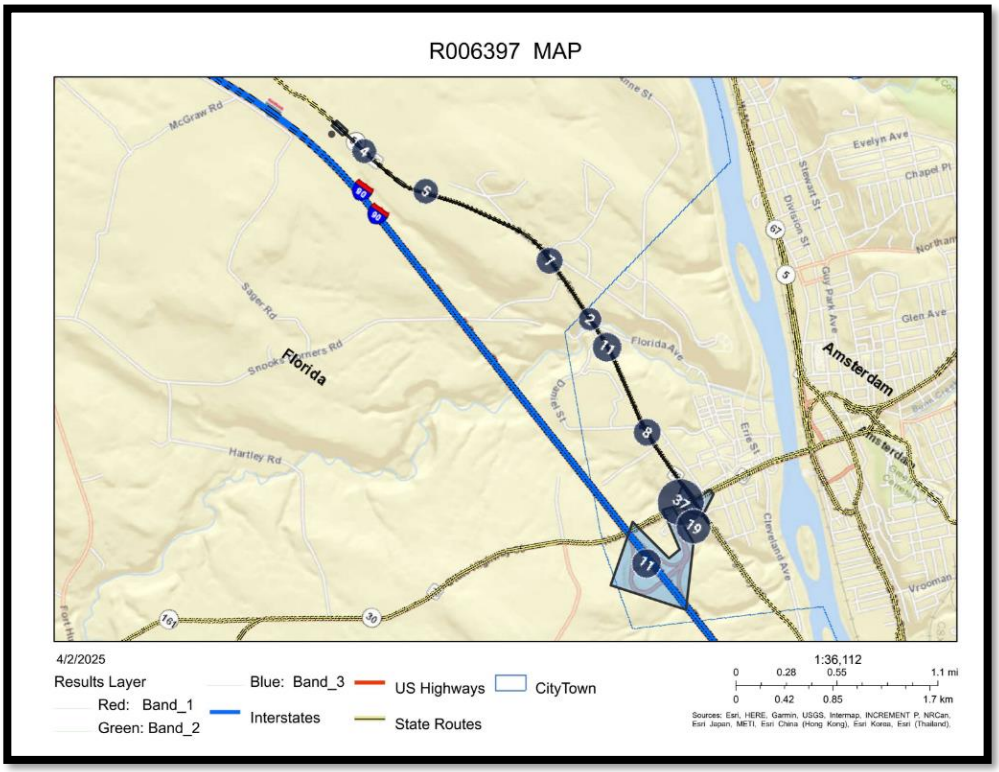

Exhibit 1 – Crash Data Locations, Provided by NYSDOT via FOIL Request

A review of the crash data shows that from 2021 thru 2024 (four-year period) there were approximately 2 reportable crashes per month along the entire 2-mile corridor. Table 4 below summarizes the various crashes during the four-year time period at the different locations depicted on Exhibit 1.

Further review of the crash reports indicates that a majority of the crashes that occurred in the study area could be attributed in part to weather conditions, distracted or negligent driving, collisions with deer, or mechanical failures of at least one involved vehicle. The identified causes are not directly attributed to any geometric deficiency. Therefore, as a result of the minimal reportable crashes during a four-year period and the attributed conditions, we expect the proposed site would have a negligible impact to crashes along the corridor.

Table 4 – Crash Data Summary, NYSDOT

Location	Year								Total	Total Property Damage	Total Injury	Total Fatalities	Crash Type
	2021		2022		2023		2024

Crash data provide by NYSDOT via FOIL request in April 2025

CONCLUSION

Langan finds, based on a review of the analyses with the improvements as identified herein, that the adjacent roadway network and proposed driveway system has the capacity to accommodate the anticipated traffic generated by typical operation of the proposed warehouse. Moreover, with the proposed improvements, discussed below, the development will not create any significant adverse impacts to traffic operations in the study area during peak hours. Additionally, the site's access points will operate at acceptable levels of service (LOS) during peak traffic hours under all conditions.

We recommend the following improvements associated with the access to the site:

- NYS Route 5S and Target Driveway East/Central Driveway
    - Widen NYS Route 5S to provide an exclusive westbound left-turn lane with approximately 400 feet of storage.
    - Signalize the intersection.
- NYS Route 5S and West Driveway (truck access only)
    - Within the existing median provide an exclusive westbound left-turn lane with approximately 200 feet of storage.

The design of the driveways and associated improvements will be in accordance with the NYSDOT (New York State Department of Transportation) design standards.

Additionally, as discussed previously, Langan recommends that three access points are necessary for the following reasons:

- The primary objective of the site access is to minimize interaction between passenger car and truck traffic within the site circulation.
    - Separate access to the truck court is established. Based on the layout of the truck court, the western driveway location allows the ability to provide appropriate stacking in advance of the guardhouse in addition to providing the necessary trailer parking spaces to support typical operations.
- The site has significant frontage along NYS Route 5S (approximately 4,000 feet).
- Site constraints, including existing easements, wetland disturbance, and grade conditions limit the location of access points and internal circulation connections.
- Due to site constraints, the layout of the employee parking area results in the necessity of two access points, one on each end of the parking fields.
- Reduce impacts to the NYS Route 5S corridor and adjacent properties by providing efficient access and appropriate on-site circulation.

Walked	0	±13
Other means	0	±13
Worked from home	101	±50

Table Notes

Means of Transportation to Work

Survey/Program: American Community Survey
Universe: Workers 16 years and over
Year: 2023
Estimates: 5-Year
Table ID: B08301

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, the decennial census is the official source of population totals for April 1st each decennial year. In between censuses, the Census Bureau's Population Estimates Program produces and disseminates the official estimates of the population for the nation, states, counties, cities, and towns and estimates of housing units and the group quarters population for states and counties.

Information about the American Community Survey (ACS) can be found on the ACS website. Supporting documentation including code lists, subject definitions, data accuracy, and statisti testing, and a full list of ACS tables and table shells (without estimates) can be found on the Technical Documentation section of the ACS website.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

Source: U.S. Census Bureau, 2019-2023 American Community Survey 5-Year Estimates

ACS data generally reflect the geographic boundaries of legal and statistical areas as of January 1 of the estimate year. For more information, see Geography Boundaries by Year.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin o error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates subject to nonsampling error (for a discussion of nonsampling variability, see ACS Technical Documentation). The effect of nonsampling error is not represented in these tables.

Users must consider potential differences in geographic boundaries, questionnaire content or coding, or other methodological issues when comparing ACS data from different years. Statistically significant differences shown in ACS Comparison Profiles, or in data users' own analysis, may be the result of these differences and thus might not necessarily reflect changes the social, economic, housing, or demographic characteristics being compared. For more information, see Comparing ACS Data.

Workers include members of the Armed Forces and civilians who were at work last week.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on 2020 Census data. As a result, data for urban and rural are from the ACS do not necessarily reflect the results of ongoing urbanization.

Explanation of Symbols:

-
The estimate could not be computed because there were an insufficient number of sample observations. For a ratio of medians estimate, one or both of the median estimates falls in the lowest interval or highest interval of an open-ended distribution. For a 5-year median estimate, the margin of error associated with a median was larger than the median itself.

N
The estimate or margin of error cannot be displayed because there were an insufficient number of sample cases in the selected geographic area.

(X)
The estimate or margin of error is not applicable or not available.

median-
The median falls in the lowest interval of an open-ended distribution (for example "2,500-")

median+
The median falls in the highest interval of an open-ended distribution (for example "250,000+").

**
The margin of error could not be computed because there were an insufficient number of sample observations.

***
The margin of error could not be computed because the median falls in the lowest interval or highest interval of an open-ended distribution.

*****
A margin of error is not appropriate because the corresponding estimate is controlled to an independent population or housing estimate. Effectively, the corresponding estimate has no sampling error and the margin of error may be treated as zero.

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

APPENDIX G
TRAFFIC SIGNAL WARRANT REPORT

Warrants Analysis

File Name:	2 - Peak Hour Volume Warrant - NYSRt5S & TargetDr.xsw
Analyst:	PS
Agency:	Langan
Date Performed:	4/7/2025
Time Analyzed:	Weekday
Jurisdiction:	NYS Route 5S & Target Driveway East / Central Driveway
Analysis Year:	2027
Project Description:	Build Condition
Units:	U.S. Customary
MUTCD Method:	MUTCD 11 (2023)

General

Major Street Direction: East-West	Starting Time Interval: 6:00
Major Street Speed (mi/h): 55	Nearest Signal (ft): 9500
Coordinated Signal System: No	Population <10,000: Yes

School Crossing and Roadway Network

Number of Students in Highest Hour: 0	Two or More Major Routes: No
Number of Adequate Gaps in Period: 0	Weekend Count: No
Number of Minutes in Period: 0	5-year Growth Factor (%): 0

Railroad Crossing

Grade Crossing Approach: None	Rail Traffic (trains/day): 4
Highest Volume Hour with Trains: Unknown	High Occupancy Buses (%): 0
Distance to Stop Line (ft): -	Tractor-Trailer Trucks (%): 10

Crash Experience

Adequate Trials of Crash Experience Alternatives: No

One-Year Period	Three-Year Period
Angle Crashes (All Severities): 0	Angle Crashes (All Severities): 0
Angle Crashes (Fatal-and-Injury): 0	Angle Crashes (Fatal-and-Injury): 0
Pedestrian Crashes (All Severities): 0	Pedestrian Crashes (All Severities): 0
Pedestrian Crashes (Fatal-and-Injury): 0	Pedestrian Crashes (Fatal-and-Injury): 0

Results

Warrant 1: Eight-Hour Vehicular Volume [ ]
- A. Minimum Vehicular Volumes [ ]
- B. Interruption of Continuous Traffic [ ]
- 56% Vehicular --and-- Interruption Volumes [ ]

Warrant 2: Four-Hour Vehicular Volume [ ]
- Four-Hour Vehicular Volumes [ ]

Warrant 3: Peak Hour [X]
- A. Peak-Hour Conditions [X]
- B. Peak-Hour Vehicular Volume Hours Met [ ]

Warrant 4: Pedestrian Volume [ ]
- A. Four Hour Volumes [ ]
- B. One-Hour Volumes [ ]

Warrant 5: School Crossing [ ]
- Gaps Same Period [ ]
- Student Volumes [ ]
- Nearest Traffic Control Signal [X]

Warrant 6: Coordinated Signal System [ ]
- Degree of Platooning [ ]

Warrant 7: Crash Experience [ ]
   A. Adequate Trials of Alternatives [ ]
   B. Reported Crashes [ ]
     B1. Angle Crashes and Pedestrian Crashes within a 1-year Period (All Severities) [ ]
     B2. Angle Crashes and Pedestrian Crashes within a 1-year Period (Fatal-and-Injury) [ ]
     B3. Angle Crashes and Pedestrian Crashes within a 3-year Period (All Severities) [ ]
     B4. Angle Crashes and Pedestrian Crashes within a 3-year Period (Fatal-and-Injury) [ ]
   C. 56% Volumes for Warrants 1A, 1B --or-- 4 [ ]

Warrant 8: Roadway Network [ ]
   A. Weekday Volume [ ]
   B. Weekend Volume [ ]

Warrant 9: Grade Crossing [ ]
   A. Grade Crossing within 140 ft --and-- [ ]
   B. Peak-Hour Vehicular Volumes [ ]

APPENDIX 19

INTRODUCTION

Ostergaard Acoustical Associates (OAA) was requested to conduct an evaluation of potential sound emissions from a proposed distribution facility in the Town of Florida, Montgomery County, New York. The site is currently a vacant parcel located between New York State Route 5S and the New York State Throughway, bordering Mead Road to the East. Plans call for construction of a warehouse which will store and distribute goods to the shipping network.

The site is anticipated to operate at all hours of the day and night. This report addresses the on-site noise radiated from this project to off-site potentially noise-sensitive receptors. Sound produced by the site will comprise steady sound from rooftop HVAC equipment as well as intermittent sound from truck and car[1] activity.

The purpose of this sound study is to analyze future site sound emissions for comparison with applicable code limits, to protect potentially noise sensitive receptors, and to evaluate the potential for noise complaints. Evaluations included conducting an ambient sound survey as well as developing an acoustical model of site sound emissions. Research indicates that there is no New York State noise code; however, the New York State Department of Environmental Conservation (DEC) does have guidelines for assessing and mitigating noise impacts. There are also no Montgomery County codes relating to noise. The Town of Florida mentions noise briefly in its zoning ordinance but does not provide any specific quantitative limits. Therefore, to meet the intent of Town noise provisions, expected site sound emissions from the facility were evaluated against a project goal based on the DEC guidelines and our professional experience.

Work by OAA was overseen by Benjamin C. Mueller, P.E., with assistance from OAA Staff. The representative at Bluewater Property Group coordinating this project is Sean Baggett.

All field measurements and acoustical modelling for this professional acoustical evaluation relied on analyses in octave frequency bands. However, in the interest of providing a concise report of findings, results in this report are provided using the most common metric of environmental sound, the A-weighted sound level. Full acoustical data in octave bands for all measurements and modelling are available upon request; these octave band data are consistent with the findings presented within this report.

[1] Note that throughout this report, the term "car" collectively refers to personal passenger vehicles including automobiles, vans, pick-ups, or SUVs. The term "truck" refers to heavy trucks such as over-the-road or line-haul trucks.

SITE AND VICINITY

The site is located in the northern part of the Town of Florida along New York State Route 5S. Figure 1 is an aerial image obtained from Google Earth showing the site outlined in red. Figure 1 also shows ambient survey locations, which are discussed in a subsequent section of this report. The site is in the Commercial (C-2) Zone and predominantly surrounded by non-noise sensitive receptors.

Our understanding of zoning/land uses in the various directions is as follows:

- North and Northwest of the site are two large existing warehouse facilities operated by Beech-Nut Nutrition Company and Target, respectively, in the Industrial Business Park (IBP) Zone.

- To the northeast is a collection of houses fronting along Joann Way and Broadway Extended in the Residential R-1 Zone. To the east are a few sparsely placed houses fronting on Mead Road and Snooks Corners Road. Dwellings on the west side of Mead Road are located within the C-2 zone while those on the east side are in the R-1 zone.

- The New York State Thruway, Interstate 90, abuts the southern property line of the site and is a major travel corridor in this area. Beyond the Thruway are distant and sporadic residential receptors located in the Agricultural (A) zone.

- West of the site are other commercial/industrial uses including an Amazon delivery station as well as an RV dealership located in the Commercial (C-2) zone. Further west along NY-5S is another large distribution facility.

OAA is aware that properties east of Mead Road, located on the outskirts of the City of Amsterdam, meet the disadvantaged community (DAC) criteria as defined by the Climate Justice Working Group of the New York State Energy Research and Development Authority (NYSERDA). These communities are identified to ensure that future development in the area will not disproportionately pollution burden these communities.

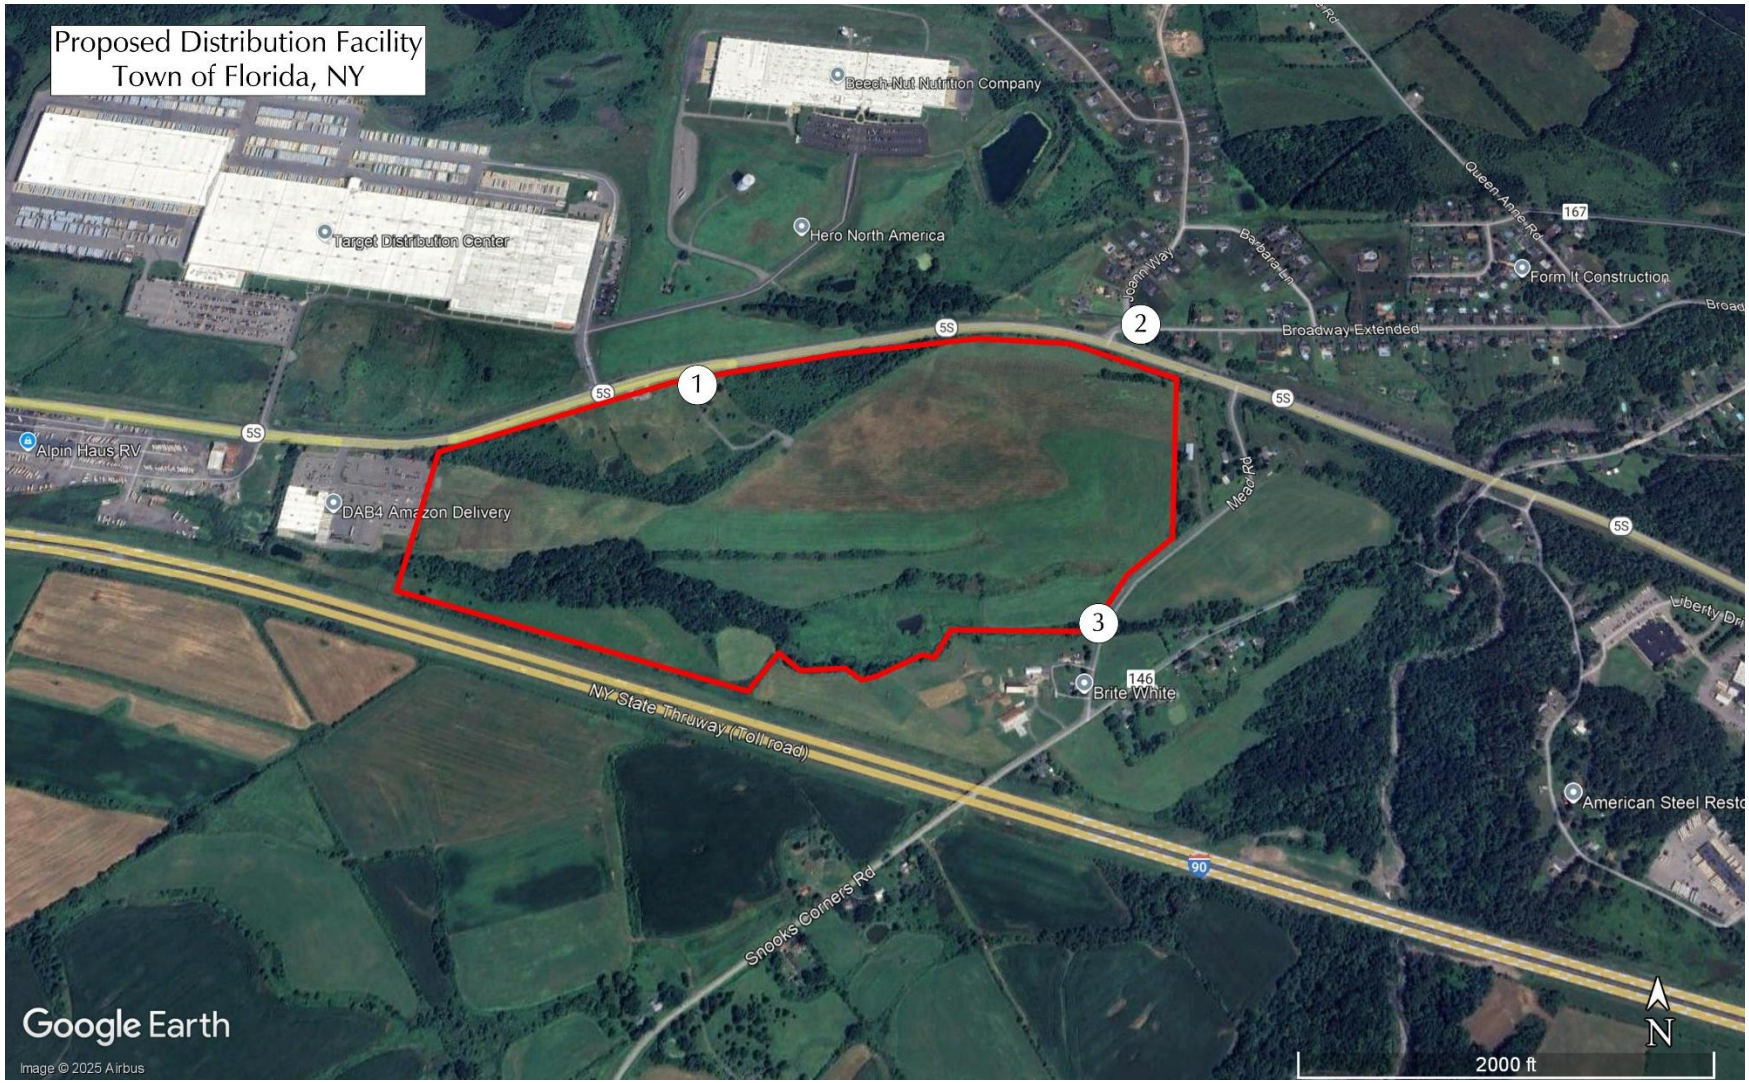

Figure 1 — Google Earth image showing the proposed distribution facility site and vicinity in the Town of Florida, NY. The site property line is approximately outlined in red. Ambient sound survey Locations 1 through 3 also shown.

Plans call for the construction of a distribution facility located in the northern portion of the property. The building footprint will be approximately 652,000 square feet. All site access will be provided via 4 driveways connecting with NY-5S to the north. Personnel vehicles will use the two dedicated driveways in the center, which will provide direct access to employee parking along the north side of the building. The easternmost driveway also provides access to these parking lots. Trucks will primarily enter and exit the site from the westernmost driveway. From there they will travel to the loading docks located on the western and southern façade of the building. During peak season, trucks will use the eastern driveway for egress only. Trailer parking areas are provided outboard of the loading docks and in the western part of the site.

Specific traffic counts depend on the end user tenant's needs. Much like the traffic study, the sound study must also rely upon professional sources of information to understand how cars and trucks will operate at this site. Professional experience and information from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition indicate that typical logistics facilities operate 24/7, like the proposed, with much of the activity occurring during the daytime hours; nighttime operations are generally used to prepare for the next day. The ITE Trip Generation Manual also contains hourly truck distribution data, based on existing sites, for a variety of ITE Land Use Codes; these distribution data confirm and support that these uses generally see majority of truck activity during the daytime period. Regardless, the sound study includes an assessment of intermittent maximum sound levels that might occur during the nighttime hours as this is generally when residential receptors are most sensitive and ambient sound levels are lower.

REGULATIONS/GOALS

When developing a site of this type, it is appropriate to consider how sound from the facility will likely be received, especially by noise-sensitive receptors. Sound produced by a typical facility such as this is primarily characterized by steady HVAC equipment sound, which is present 24/7, and on intermittent sound produced by on-site heavy truck activity. Site sound emissions from these major noise sources should be evaluated and compared to applicable noise code limits as well as acoustical goals based on professional experience. Since facility operations can potentially be 24/7, the primary concern with sound emissions is minimizing the acoustical impact/meeting goals at night at residences. As a general practice, when motor vehicles are on site, they are considered part of a site's sound emissions; when vehicles are on public roads, they are not.

State, local, and county codes were reviewed for applicable noise regulations. There are no State of New York noise code limits. However, the New York State Department of Environmental Conservation (DEC) has a policy "Assessing and Mitigating Noise Impacts" that provides guidance for analyzing and minimizing the acoustical impact applicable to the State Environmental Quality Review Act (SEQR). Guidelines require comparison of the equivalent (average) ambient sound level to proposed site sound emissions to determine the extent of potential acoustical impact, if any. The DEC states that an increase in ambient sound level by 0-to-3 dB should have no appreciable effect on receptors and an increase of 3-to-6 dB is tolerable but may have potential for an adverse noise impact only in cases where the most noise-sensitive of receptors are present. The term "the most noise-sensitive of receptors" is not defined but assumed to reference the small percent of the population who are exceptionally sensitive to noise. Increases of more than 6 dB require closer scrutiny, while increases of 10 dB deserve consideration of avoidance and mitigation measures in most cases. There is also the New York State Vehicle and Traffic (VAT) Law that states that all motor vehicles must have a muffler and must be below specific sound limits at a distance of 50 feet. Specifically, vehicles over 10,000 pounds must not exceed 86 dB(A) at speeds of 35 mph or less nor exceed 90 dB(A) at speeds above 35 mph. There are also limits for lighter weight vehicles and motorcycles. Overall, these State limits are generally easy to meet with modern, well-maintained vehicles.

A review of the Town of Florida Zoning Ordinance qualitatively discusses noise and does not provide any numerical limits pertaining to site sound emissions. Section 45.4 Wind Turbine Facilities Law calls for wind energy conversion systems to not exceed 50 dB(A) at the receptor's boundary. While not applicable to this project, this provision gives some incite to the Town's goal for stationary, steady noise sources. Overall, the intent of zoning ordinance is to not have any offensive noise that impacts adjoining properties. There are no Montgomery County noise codes that could be found.

In summary, outside of the Town code inferring that a sound pressure level of 50 dB(A) is acceptable for certain wind energy equipment, there are no applicable noise code limits that apply to site sound emissions. VAT Law noise limits are relative to the motor vehicle and not the receptor and hence are not useful in evaluating the possible impacts. The State DEC guidelines provide the best direction to minimize any potential acoustical impacts. To comply with these guidelines, the project must show that site sound does not substantially deviate from existing ambient sound levels near residential receptors. Specifically, future sound in the area with the proposed site included, should not increase existing equivalent ambient sound conditions by

more than 6 dB to avoid any negative acoustical impact to the area. DEC guidelines are also suitable criteria to use for evaluation of areas designated as DAC.

Sound Level Survey

To determine appropriate criteria for comparison to DEC guidelines, an ambient sound survey was carried out to document existing ambient noise levels in the area. A total of three long-term sound level monitor locations were selected to typify existing ambient sound levels around the site. These survey locations are shown in Figure 1. Monitors were placed either on site or within public rights-of-way and were kept distant from active roadways to the extent feasible.

Location 1 is on-site, approximately where the western personnel driveway is planned to be located. Location 2 is northeast of the site at the intersection of Joann Way and Broadway Extended on a public right of way. Location 3 is along Mead Road, near the culvert crossing. OAA staff deployed the monitors on the morning of 7 March 2025 and retrieved the units on the evening of 17 March 2025.

For each Location, a Piccolo II sound level monitor was placed within a weather enclosure and mounted to either a tree or public utility pole. A windscreen was used on the microphone. Monitors were instructed to record detailed octave band time history data at one-minute intervals for the duration of the survey. Statistical data were also obtained. Monitors recorded data from deployment until the battery was depleted or the memory ran out, whichever came first.

The survey data generally spanned from about 1600 hours on Friday 7 March to 0500 hours on Friday 14 March. Data at Location 2 stopped at 1300 hours on 10 March 2025 due to a spent battery. All sound level monitors were calibrated before deployment using a HBK Model 4231 sound level calibrator, which is calibrated by an outside calibration service annually. It was observed upon deployment and retrieval of the long-term monitors that the acoustical environment was dominated by steady traffic flow resulting from the well-traveled roadway of NY-5S.

Weather conditions were generally appropriate for the survey based on a review of historical data obtained from the nearest weather station at Albany International Airport. Temperatures ranged from 27-to-70 degrees Fahrenheit throughout the survey, with no significant precipitation. There were occasions of high wind gusts above 25 mph on 7 and 11 March; wind

speeds outside of these two days averaged between 7 and 11mph. It is worth mentioning that while the weather station may record high wind speeds at times, these are generally not realized at the height of the microphones; no contamination of survey data was observed from wind or wind gusts.

Acquisition of ambient sound data over the course of multiple days results in an enormous amount of data. As a result, it is helpful to review data as hourly statistics to assist with observing ambient sound level trends. Important statistics include the average, or equivalent, sound level (L_{eq}), which is the metric that the DEC guidelines use, and the background sound level (L_{90}), or level that occurs over 90 percent of the time. The background sound level is best used to evaluate continuous noise sources such as project HVAC sound. The L_{10}, or level that occurs over 10 percent of the time, indicates the extent of intrusive noise sources in the area, such as dog barks, surges in traffic noise, or aircraft passbys; the L_{10} is best used to evaluate intermittent motor vehicle noise from the proposed project. The purpose of this survey was to understand the existing acoustical conditions for comparison to project emissions. These data are important for use in establishing specific project noise goals to ensure no negative acoustical impact.

A summary of the hourly A-weighted statistical sound levels recorded and linearly averaged over the entire period of the survey is provided in the following table:

Location	L_{Max}	L_{10}	L_{eq}	L_{90}	L_{Min}
1	64	61	59	55	52
2	73	67	63	54	50
3	60	56	54	51	48

Time history data obtained during the survey are provided graphically at 1-minute average sound levels in the Appendix.

A review of the survey results revealed that sound levels were somewhat higher during the first few days of the survey period half of the week compared to the later part of the survey. This was particularly noted at Location 1. This trend would have been mimicked at Location 2, given its proximity to NY-5S, however the survey period ended early. This trend is not seen at Location

3. As ambient surveys will regularly exhibit nuances, it is best to review them from a high level and with a conservative slant.

A high-level analysis of the data reveals that sound levels along the NY-5S corridor were higher than those at Location 3 along Mead Road. Background sound levels for all locations hover around 50 dB(A), which is the limit used by the Town for wind electrical systems. Survey results support using this as a goal for steady sound levels in the area. Average sound levels in the area hover around the mid-50s on an A-weighted scale. Results also show that sound levels during the nighttime hours are dynamic and vary between short period lulls of 40 dB(A) and around 55 dB(A) across most nighttime hours. Daytime ranges increase by about 15 dB to 55 to 70 dB(A). This is typical for areas proximate to well-travelled roadways.

Project Noise Goals

Local and state codes generally will dictate quantitative limits for receptors for the purpose of protecting the health, safety, and wellbeing of the public. While there are some references provided by the Town of Florida, the New York DEC guidelines take the logical approach of establishing a project goal relative to the existing ambient sound level of the area. The intent of the DEC guidelines is to make sure that site sound does not cause any excessive deviations from the existing ambient sound of the area. This is defined by an increase in 6 dB(A) from the equivalent ambient sound level. Taking a conservative approach of using the lowest L_{eq}, which is 54 dB(A) at Location 3, this results in a project noise goal to not exceed a cumulative sound level of 60 dB(A) with the project in operation. While based on existing conditions, continuous sound levels of this magnitude are generally permissive.

Based on experience, OAA recommends slightly more conservative noise goals to ensure there is no negative impact. Background sound produced by the project's steady HVAC equipment should be controlled to not exceed 45 dB(A) at residential receptors. Similarly, maximum sound levels produced by intermittent on-site truck operations should not exceed 55 dB(A) at off-site residential receptors. These limits align with maximum and minimum sound level trends seen at Location 3 during the nighttime hours. Meeting these goals will ensure that receptors are not disturbed by any excessive noise, meet the intent of local ordinances, and ensure full compliance with DEC guidelines.

EXPECTED SOUND EMISSIONS

Acoustical modelling software, specifically CadnaA, was used to model expected site sound emissions for the site. The model takes into account relevant parameters between the noise source and receptor positions of interest to predict how sound will propagate. In addition to distance attenuation, the model accounts for the effects of terrain, various types of ground cover, shielding by structures, and reflections from buildings. In the model, buildings are white and the site property line is outlined in red. On-site topography was provided by the project team; offsite elevation information was obtained from ArcGIS software. Elevation contours are shown in teal in the model. North is pointing up in all figures. The scale in each figure is in feet.

The acoustical model shows the results graphically as A-weighted sound level contours, in 1 dB increments, and tabulates the summed A-weighted sound levels at four discrete locations at nearby residential receptors of interest. Sound level contours are at ear height, 5 feet above grade. Receptors A through D are at the façade of nearby residences and are located at a height of 15 feet above grade, typifying an upper story receptor for a two-story house.

Rooftop HVAC Equipment

Rooftop HVAC equipment produces noise that is steady in nature, and hence will not vary over time. Using a mechanical design template for the proposed building, noise sources were placed on the rooftop of the building. While all HVAC equipment is modelled, the focus of this study is on the large HVAC units, those with a heating/cooling capacity of 25-tons or greater. Smaller HVAC equipment produces lower sound levels and is of less concern. In all, this project is expected to have 60 HVAC units that are 25-tons or larger. Most units are in the 25-to-36-ton range and were each modelled to be 93 dB(A) re 1 picowatt based on typical manufacturer's sound data; a handful of units were modeled as 125-ton units with a sound power level of 101 dB(A).

The noise from the rooftop units was included in the HVAC sound model. HVAC noise sources are shown as blue "+"s. Noise sources were placed 4 feet above the rooftop, and sound was projected off site. The model includes a 4.5-foot parapet, shown in light blue. Figure 2 shows the results graphically and tabulates the summed A-weighted sound levels at the nearby receptors of interest. The results show that, with all rooftop units operating, HVAC sound levels at off-site receptors range from 33-to-41 dB(A) at nearby receptors, meeting the project noise goal of 45 dB(A) but a sufficient margin.

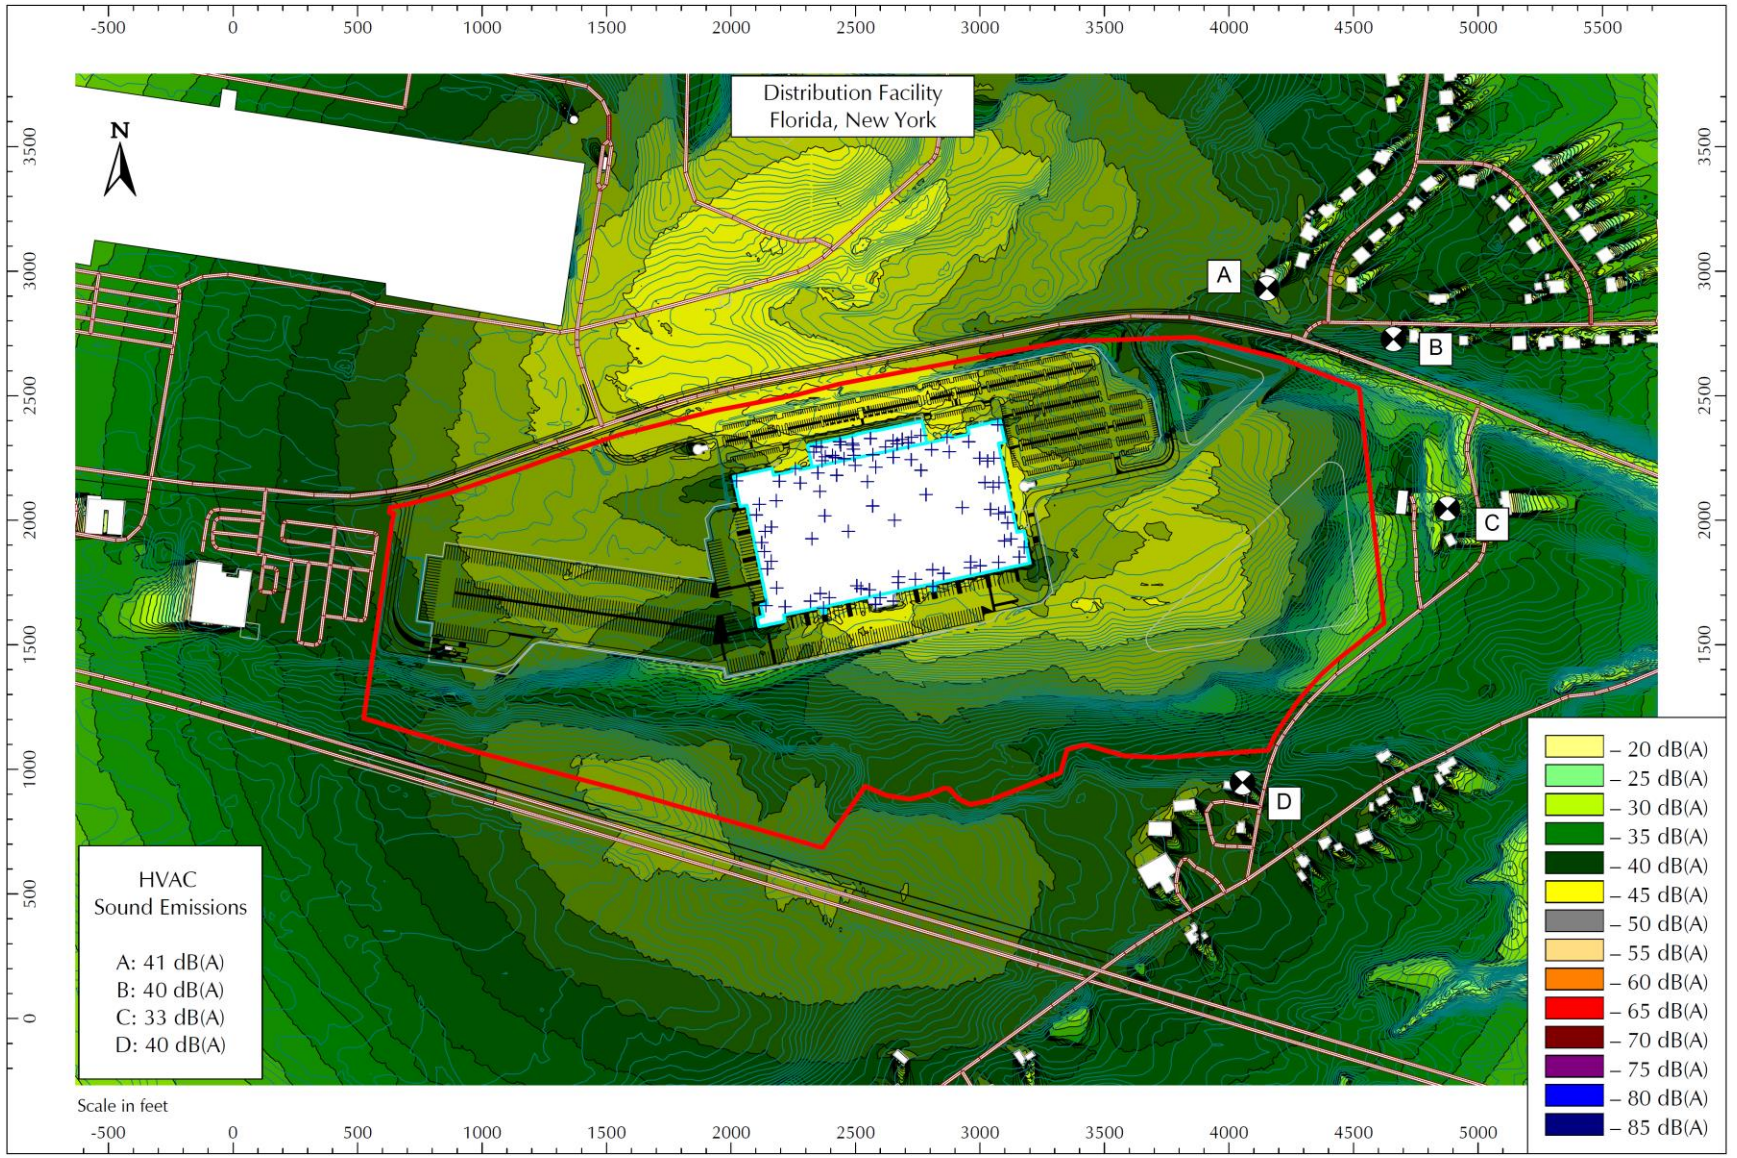

Figure 2 —A-weighted sound emission contours, 5 feet above grade, for sound from rooftop HVAC equipment. Rooftop units shown with a blue "+" sign. Buildings shown in white, site property line outlined in red, and contour lines shown in teal. Parapets shown in light blue. Receptor heights are 15 feet above grade.

This analysis shows that there is little concern about HVAC sound. HVAC sound is sufficiently controlled via distance and roof shielding effects so that noise meets the nighttime project noise goal of 45 dB(A), 5 dB lower in level than Town limits for wind energy systems. "Roof shielding effects" refers to the fact that the roof and parapet act as an acoustical barrier for rooftop equipment for vantage points closer to the ground when the rooftop equipment is screened from view. Roof shielding effects are less prominent for upper story receptor vantage points that may be higher than the HVAC equipment. Note that for these model results to be realized, acoustical performance of HVAC equipment must be aligned with what was modelled.

Truck Activity

OAA has had the opportunity to visit various logistics facilities and industrial parks over the years to survey and document the sounds of truck activity. The logistics facility will have over-the-road line-haul trucks and potentially have terminal tractors (yard tractors) active on site. Line-haul trucks deliver trailers from off-site whereas terminal tractors do not leave the site and move trailers between the docks and parking areas. Terminal tractors are responsible for most back-up movements on-site. From an acoustical aspect, terminal tractors and line-haul trucks are acoustically equivalent.

Truck noise in a typical truck court can produce maximum sound levels of 79 dB(A) when measured at a distance of 50 feet from the source. This sound level was determined by looking at a wide variety of intermittent truck activity, such as truck movement, air brakes, back-up alarms, and coupling/decoupling, and distilling it to a single conservative maximum level and spectrum for use in acoustical studies such as this. A driving truck exhibits slightly lower maximum sound levels of 74 dB(A) when measured 50 feet from the source. A driving box truck produces maximum sound levels of 70 dB(A) at 50 feet. It is also important to recognize that these truck activities are dynamic in nature. Maximum sound levels from these events only occur for a short duration and are not representative of the constant sound level produced by the site.

The above discussion applies to the short duration, intermittent operations which are mobile and highly dynamic. Stationary noise sources within the truck court on site include loading and unloading of trucks as well as trucks idling. These activities produce a repetitive, albeit temporary, sound, and are present for a longer period than the intermittent truck noise sources. Loading/unloaded activity at a dock is estimated to produce maximum sound levels of 70 dB(A)

at a distance of 50 feet. This is due to internal forklift operations, for example. Trucks idling exhibit maximum sound levels of 62 dB(A) at a distance of 50 feet.

The height of a truck source for all truck activity is modelled at a conservative height of 8 feet above grade. OAA has found that using these maximum sound levels at this height ensures a conservative approach to evaluating truck sound within the truck court. When specific individual activities are modelled at their actual height and sound level, results are typically lower in level than predicted below. For example, many of the high sound level activities, such as back-up alarms and air brakes, occur at a height of 4 feet above grade, not 8 feet. This is a critical detail when evaluating the effectiveness of a sound barrier or berm and when considering intervening topography.

While there will be multiple trucks onsite at any given time, it is generally appropriate to evaluate maximum sound from an individual truck. Several factors support this. Because maximum levels are dynamic and short in duration, it is unlikely that multiple truck sound level maximums will occur at exactly the same time and location. In addition, safe practices restrict more than one truck from operating in proximity to each other in the same vicinity. Hence, off-site maximum sound levels will be driven by individual truck sources. In the unlikely event that two truck sources would contribute the same level in the same location at the exact same time, maximum emissions would only be 3 dB higher due to the logarithmic nature of sound pressure level addition.

Despite this, OAA has modeled eight driving trucks and five truck loading events on the site at the same time, at various on-site locations that are nearest to receptors, to be conservative. This is considered extremely conservative given trip counts expect on average about eight trucks per hour. Truck sources were placed across the entire site at positions where sound emissions produce the highest levels. Driving trucks, shown as pink "+", are modeled with a sound pressure level of 74 dB(A) at 50 feet. Sound contributions from truck dock activity are shown as white "+"s, and each are modeled with a sound pressure level of 79 dB(A) at 50 feet. HVAC noise sources were also included in the model to represent worst-case conditions, and are shown as blue "+"s.

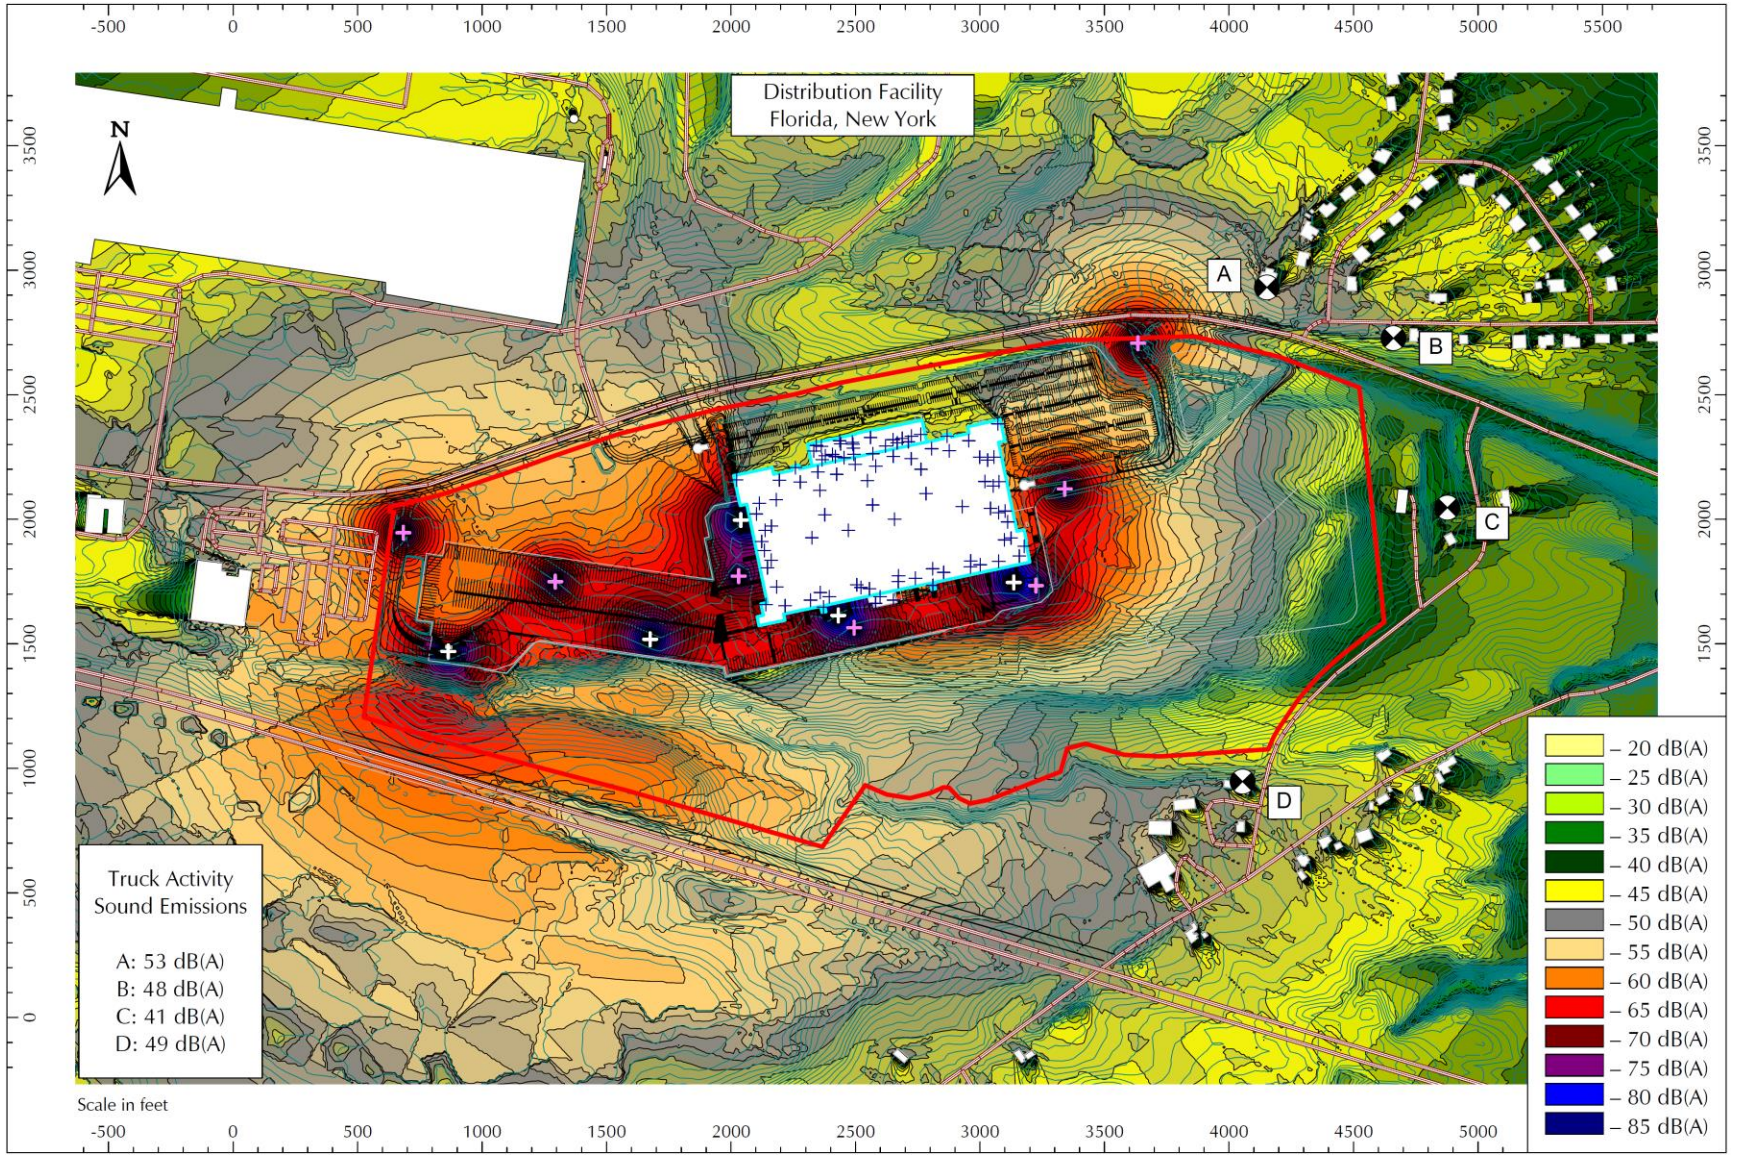

Figure 3 —A-weighted sound emission contours, 5 feet above grade, for sound from truck activity added to the HVAC results of Figure 2. Eight driving trucks (pink +) and five truck events (white +) are shown. Buildings shown in white, site property line outlined in red, and contour lines shown in teal. Receptor heights are 15 feet above grade.

Figure 3 provides the results of eight driving trucks and five truck events on site at the same time. Maximum off-site sound levels range from 41-to-53 dB(A), meeting the 55 dB(A) project noise goal for intermittent on-site activity. Levels of this magnitude are similar to ambient sound level trends observed during the sound survey, which will allow site operations to blend in with existing conditions.

The results of Figure 3 can be further scrutinized for comparison to DEC guidelines. DEC guidelines look at equivalent sound levels produced by the site over a period of time whereas model results above are a depiction of maximum sound levels, which represent a short moment in time. Equivalent site sound levels will be significantly lower than what is presented here. Hence, use of model results for comparison to DEC criteria are extremely conservative. Future sound levels in the area are estimated by combining model results from Figure 3, which includes both HVAC and truck activity, to the lowest existing equivalent ambient sound levels of 54 dB(A), which was documented across the measurement period at Location 3. The existing equivalent ambient sound level was then combined with the maximum sound level shown above to estimate the future equivalent sound levels. The calculated future equivalent sound level results can then be used to compare to DEC project goals. The results of these calculations are summarized as follows:

Location	Existing Equivalent Ambient Sound Level, dB(A)	Maximum Site Sound Emissions, dB(A)	Future Equivalent Sound Levels, dB(A)	Change from Existing to Future
A	54	53	57	3
B	54	48	55	1
C	54	41	54	0
D	54	49	55	1

Results in the above table show that the worst-case potential change in sound levels from existing conditions to future conditions is 0 to 3 dB. DEC guidelines state that changes below 6 dB have no negative effect on receptors in the area. Additionally, because of the conservative nature of this analysis, any actual changes will be much lower than is what is presented here. Table results are based on the assumption that maximum sound levels produced by trucks are present 24/7, which is an overestimation of this intermittent source. The results in the conservative analyses above support that this project will have no negative acoustical impact on the surrounding area, according to DEC guidelines.

Off-site Evaluation

While off-site truck routes are not regulated by noise codes, they were reviewed to evaluate their potential for acoustical impact. Trucks must fully comply with all VAT motor vehicle noise limits; however, they are relative to the vehicle and not the receptor and hence such limits are not helpful for evaluating potential noise impacts. All trucks are expected to be coming from and going to the site via Interstate 90, using the interchange east of the site to access NY-5S. This truck route is already heavily traveled by other trucks coming and going from similar existing logistics facilities along the same stretch of road. All trucks will utilize approved truck routes and will blend in with existing traffic flow sound in the area.

An accurate acoustical evaluation of off-site impacts is challenging given the volume of motor vehicles is constantly fluctuating and comprised of a variety of personal and commercial motor vehicles. Despite this, it can be evaluated from a high level. This evaluation is particularly prudent given that a portion of NY-5S travels through a DAC area just east of the site.

Ambient sound survey results obtained at Locations 1 and 2 along the NY-5S corridor show that average sound levels along this route are 59 dB(A). This sound is due to the make-up of existing motor vehicles traveling along this road. The traffic impact study (TIS), prepared by Langan and dated 9 April 2025, was reviewed to compare existing and future trip counts along NY-5S. Specifically, counts were scrutinized along NY-5S at the intersection of NY-5S and P.S. Street, which is within the DAC area. Existing and site vehicle trips were obtained from Figures 2 and 8, respectively, from the TIS report. During the peak PM generation hours between 5:30 PM and 6:30 PM, a total of 540 vehicles traveled along NY-5S, on the road segment west of P.S. Street.

According to other sections of the TIS, approximately 5 to 10% of this existing traffic is tractor trailers. Site contributions during that same peak PM period, the project would add 756 cars and 18 trucks for a total of 774 vehicles.

In simplified terms, the existing average sound level will increase based on the increase in volume of vehicles. The following formula and analysis apply:

$$Future\ Leq(1h) = Measured\ Leq + 10\log\left(\frac{total\ future\ vehicles}{existing\ vehicles}\right)$$

$$Future\ Leq(1h) = 59\ dBA + 10\log\left(\frac{1314}{540}\right)$$

$$Future\ Leq(1h) = 63\ dBA$$

Results from this simplified yet conservative analysis show that during the PM peak generation hours average sound levels could increase by 4 dB. This increase is below the NYSDEC guideline value for creating a negative impact. It should also be noted that this analysis is very conservative considering that the peak PM roadway volume of traffic is currently at 1063 trips in an hour, which is only 251 trips less than the project's peak PM generation hour. In other words, while sound levels will increase during certain hours due to the way this site will operate, the magnitude of traffic flow sound in the area will be about the same as it currently is in other hours of the day. The increase shown above is not out of the ordinary and will not negatively impact residences or the DAC area.

ADDITIONAL CONSIDERATIONS

Although construction noise is not specifically discussed in the Town code, and construction conditions are temporary in nature, it is worth discussing considerations to minimize the acoustical impact of this activity. The proposed building is over 1,00 feet from the nearest dwelling. While the building is somewhat remote, earth moving equipment used during the civil construction phase of the project could be much closer to off-site receptors temporarily. Construction equipment such as bulldozers, front end loaders, and dump trucks can typically produce maximum sound levels of 80 dB(A) at 50 feet. At assumed distances of at least 200 feet from nearby receptors, maximum construction activity sound levels would be in the upper-60s. Levels of this magnitude are not uncommon in a populated, developed area and therefore are not expected to elicit noise complaints or impact the health, safety, and welfare of the public. Sound levels far in excess of this were observed in the ambient sound survey at Location 2, along the NY-5S corridor. To minimize receptor exposure to construction noise during this phase, consider the following construction mitigation measures:

- ❑ Limit all heavy equipment operation to non-noise-sensitive daytime hours and follow allowable Town construction hours if applicable.

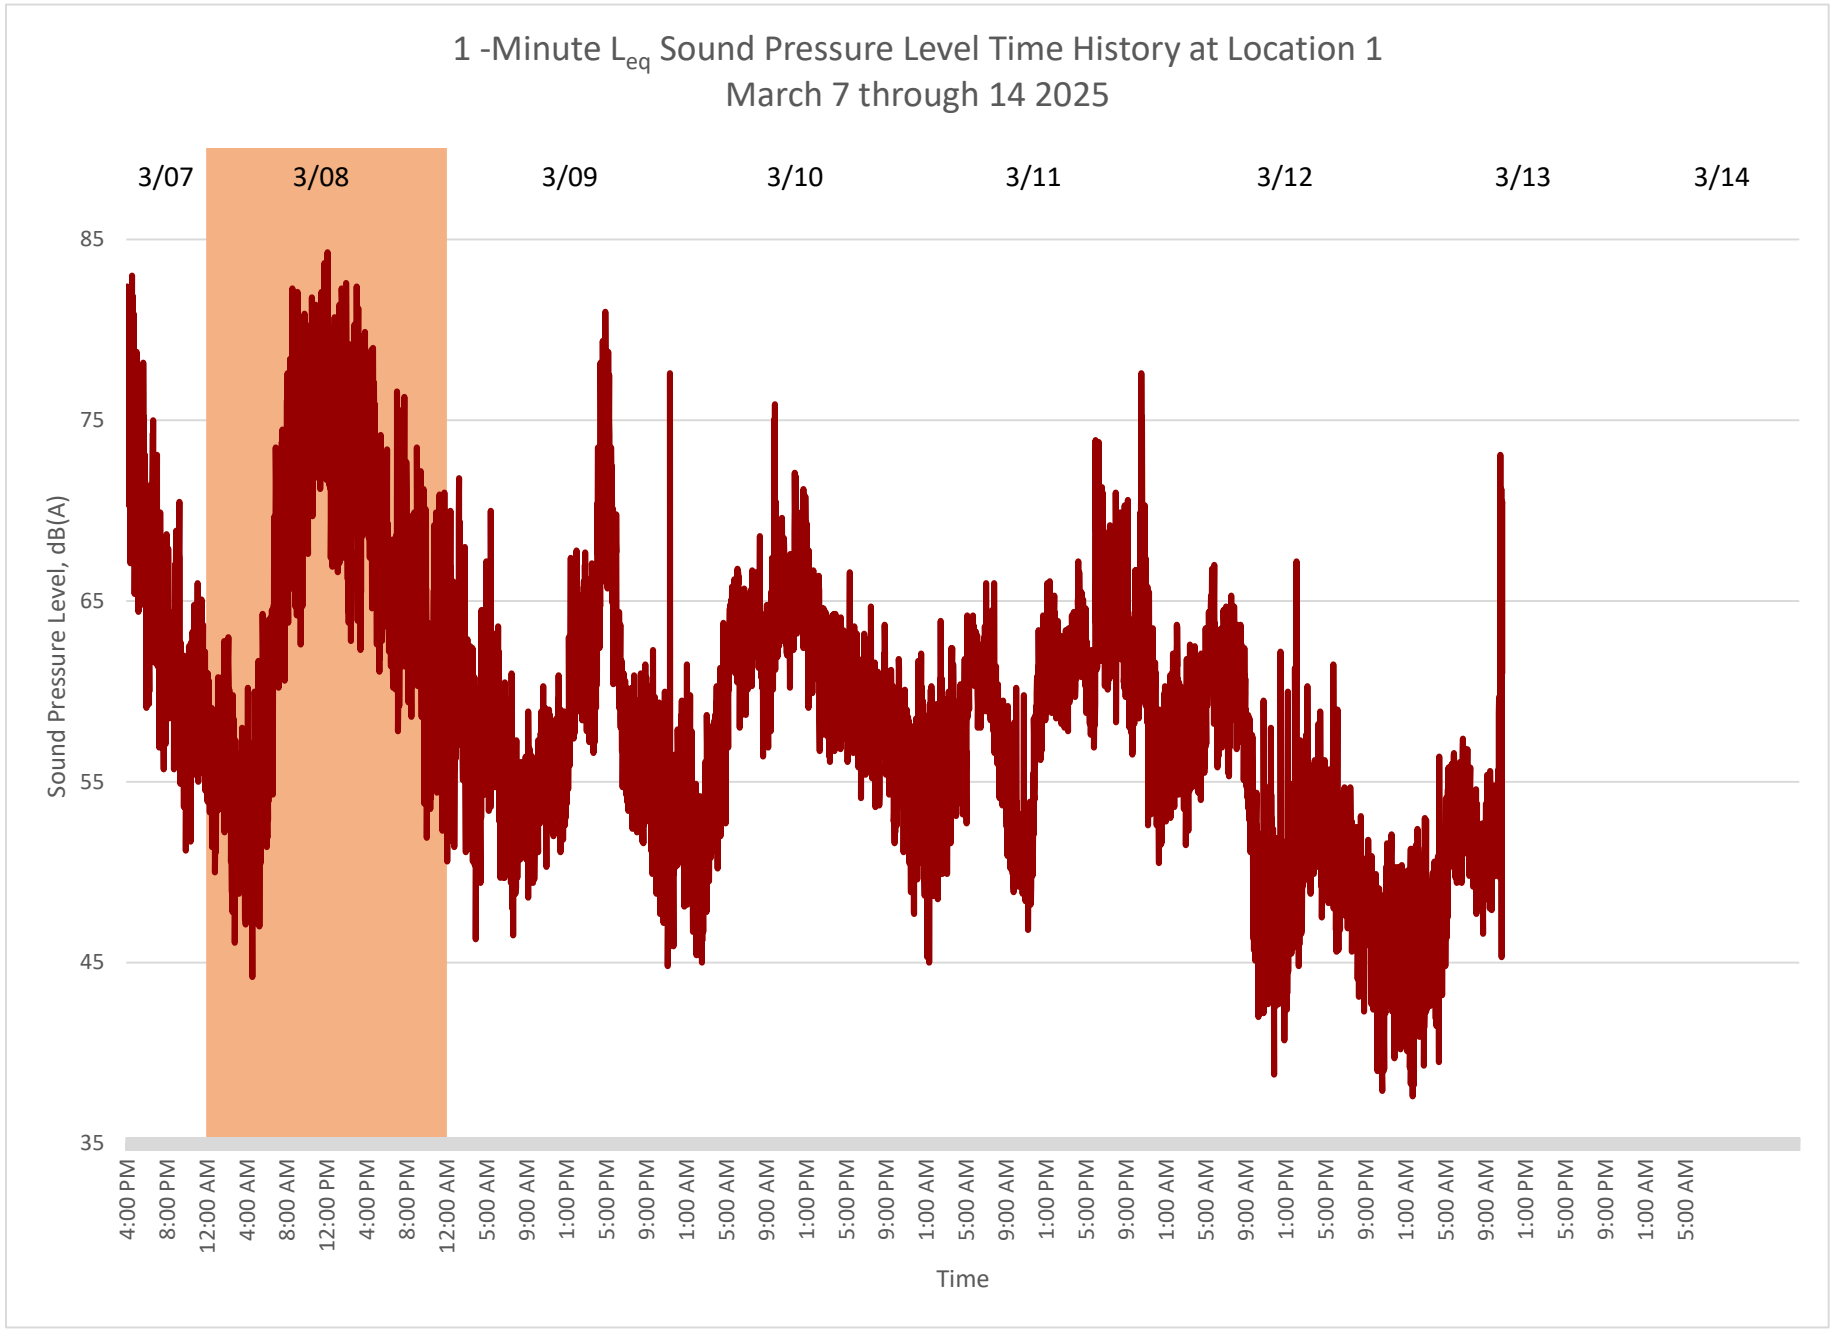
- ❑ If possible, limit the amount of equipment operating near one receptor at a given time. Avoid exposing any one receptor to high sound levels for an extended period.

- ❑ Place stationary equipment such as generators, compressors, and office trailers away from receptors.

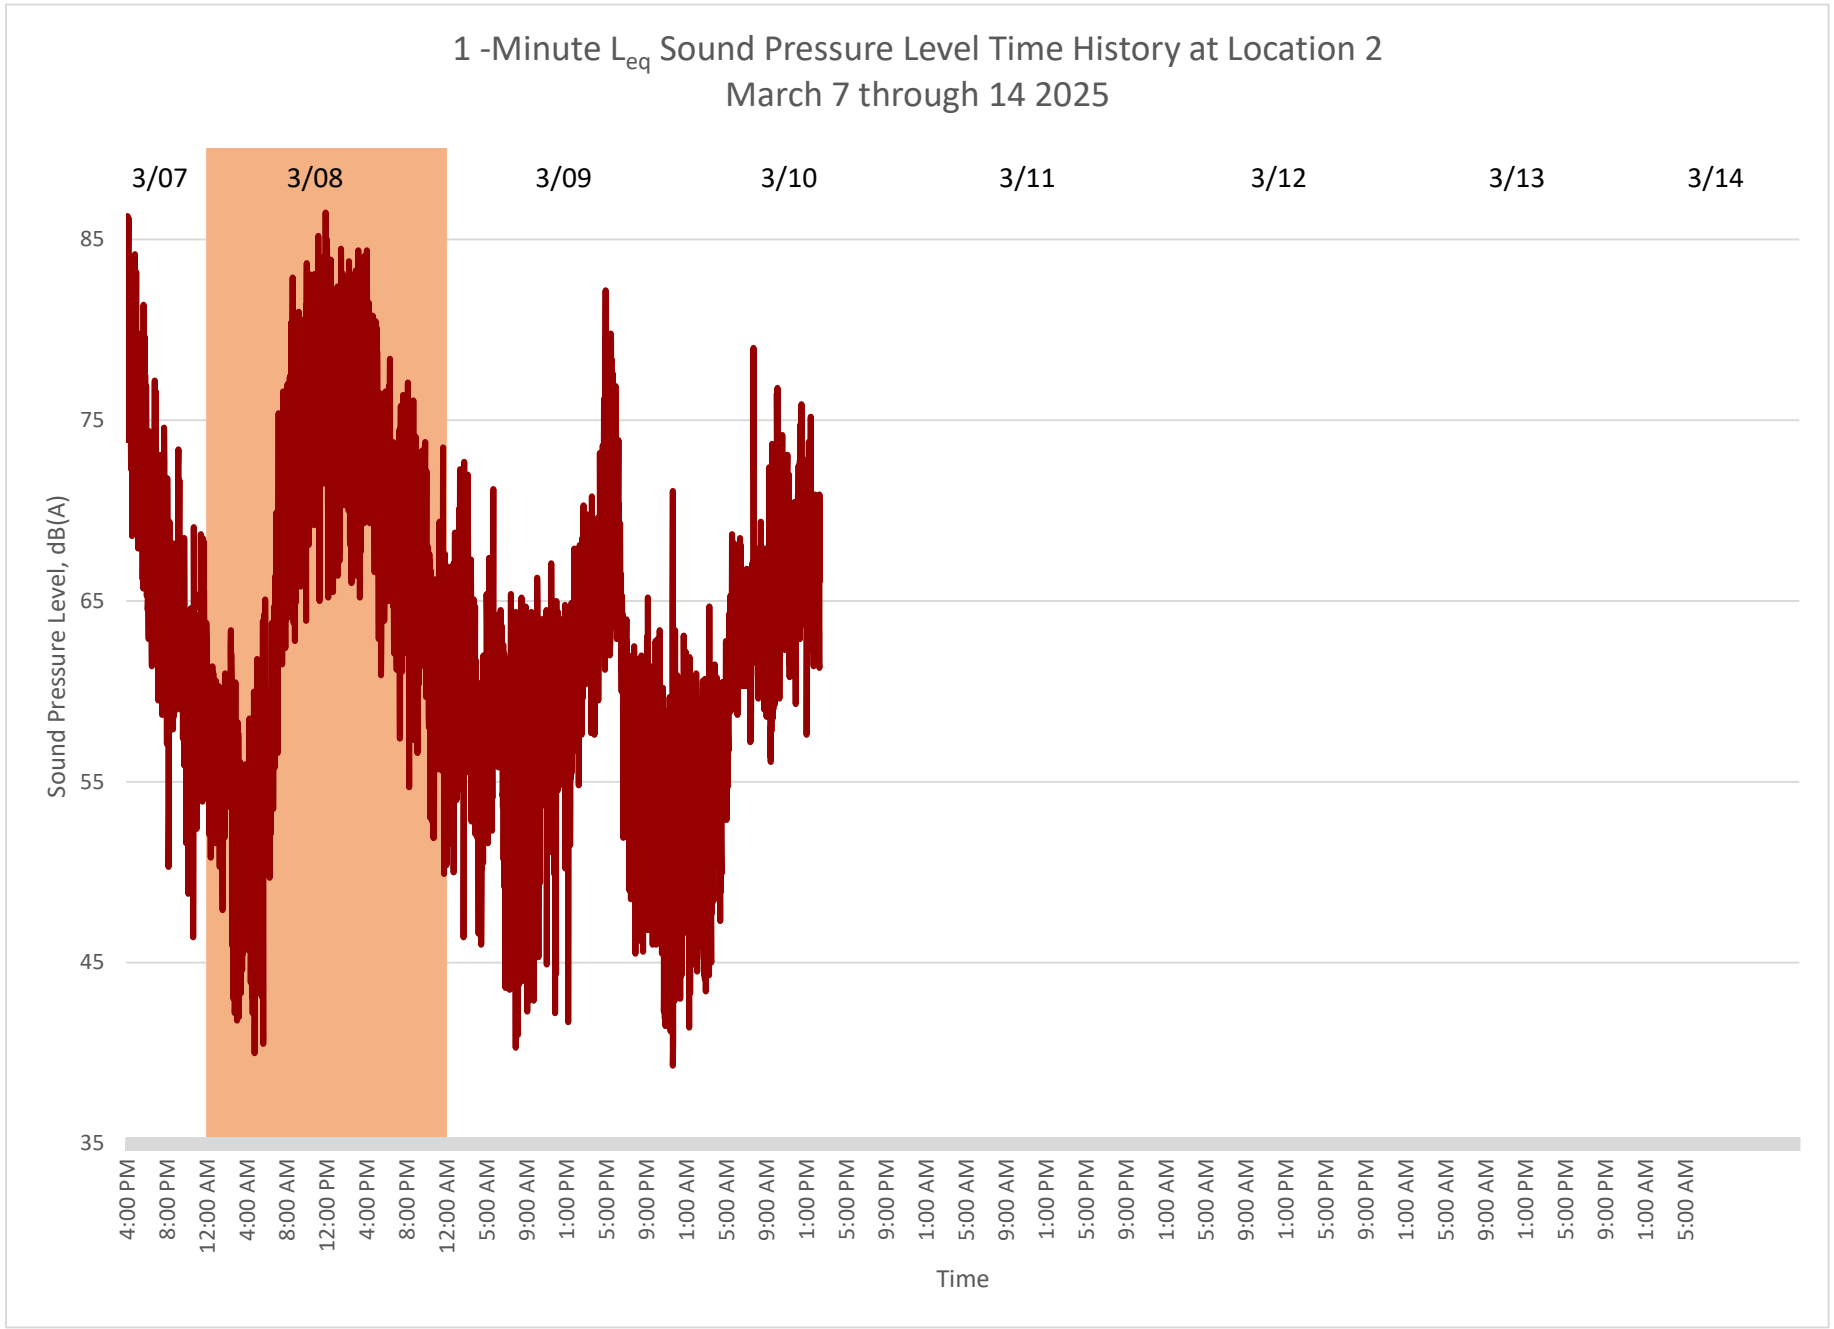
- ❑ Avoid having construction parking or laydown areas nearby receptors.

- ❑ Coordinate any high sound level construction activities with Town representatives and provide advance notice to residences as feasible.

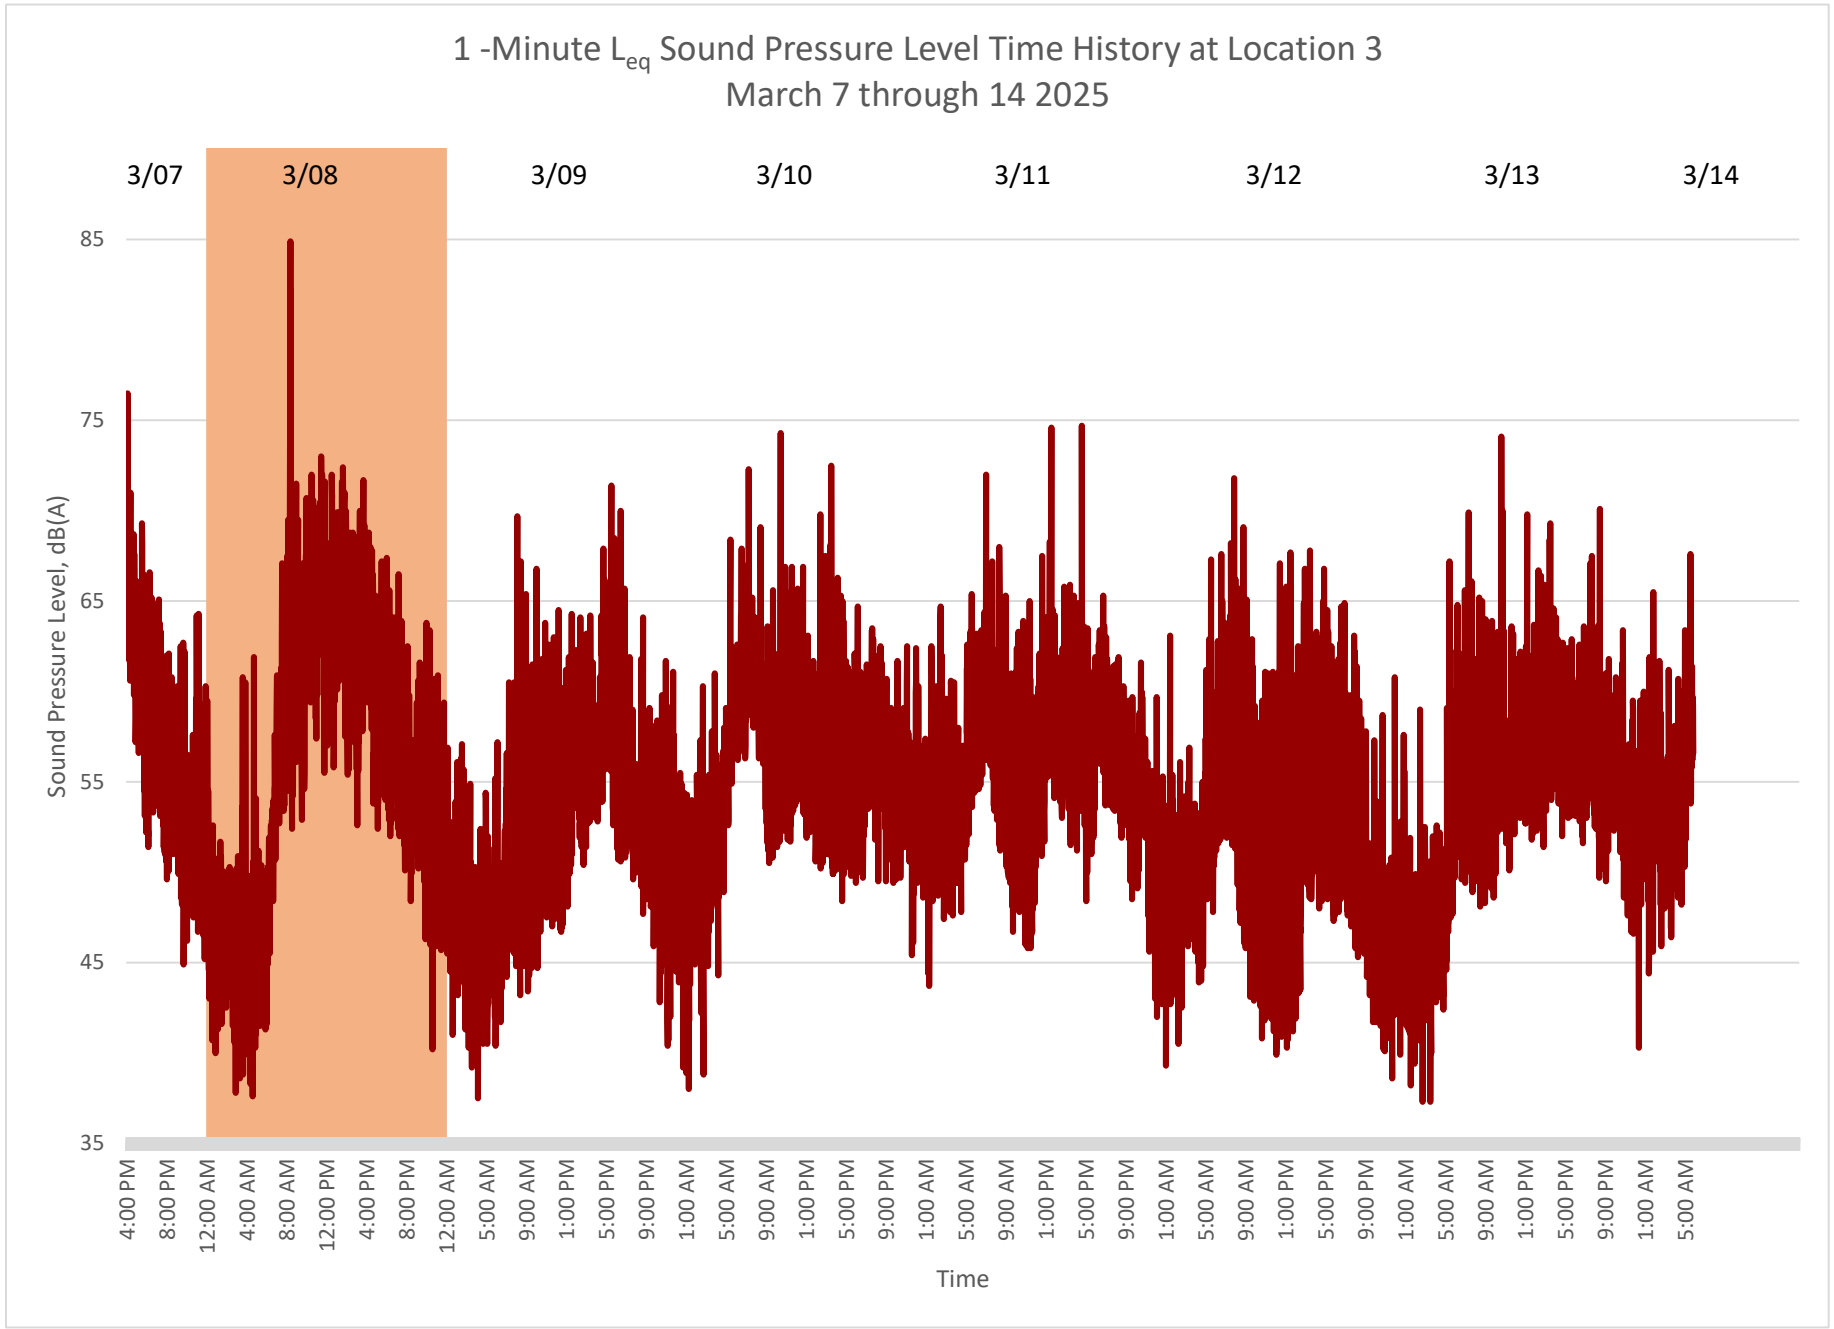
Specific noise issues can be individually evaluated for tailored noise mitigation recommendations should traditional methods above not be sufficient.



CONCLUSION



Plans call for the construction of a distribution facility located adjacent to other logistics facilities in Town, along the well-travelled NY-5S corridor. Residences are near the site to the northeast and east while commercial and industrial properties are in other directions. An acoustical evaluation was carried out to ensure that site sound emissions meet the intent of any applicable State and local noise codes, and that site sound will not deviate from existing sounds in the area. In the absence of quantitative noise code limits, a project noise goal was established for the purpose of meeting this intent, based on ambient sound survey results. Meeting project goals will ensure that the health and safety of residences are protected and that there is no negative acoustical impact at potentially noise-sensitive receptors.



Overall, the site is well laid out and adjacent to existing logistics facilities nearby the site. While residences are in the area, there is sufficient distance to allow this use to be compatible with this use. Analyses show that distance and site geometry will sufficiently attenuate on-site HVAC and motor vehicle noise to meet all project noise goals. Site sound will not have a negative impact on the immediate area bordering the site, nor at any off-site DAC areas per DEC guidelines. There are no acoustical concerns with off-site truck routes as the site will use approved truck routes along already well-travelled roads. Based on the foregoing, the findings in this report support and conclude that the project will not create any significant adverse sound impacts on any residential or disadvantaged community receptor and is appropriate for this site.

APPENDIX 19

MSV1 AMAZON DISTRIBUTION FACILITY

SITE PLAN AND SPECIAL PERMIT NARRATIVE

April 24, 2025

PROJECT DESCRIPTION

BMG Albany, LLC ("BMG") is proposing to develop property between N.Y.S. Route 5S ("Route 5S") and the New York State Thruway ("I-90") with an e-commerce logistics, storage and distribution facility on lands comprising approximately 137.24± acres in the Town of Florida (the "Town"), Montgomery County, New York (the "Project" or "MSV1"). The Project will be served by a new electric substation (the "Substation") to be separately owned by the user and operated by National Grid pursuant to an easement. The Project will be entirely built in the Town's Commercial ("C-2") zoning district on SBL # 54-1-36 (the "Project Site"), where warehouse/distribution centers are an allowed use subject to Special Permit and Site Plan approvals by the Town of Florida Planning Board (the "Planning Board") pursuant to the Town's Zoning Ordinance. Accordingly, to meet the needs of a new, specific user, BMG applied to the Planning Board for approval of MSV1 in January 2025, which together with a supplemental submission on February 20, 2025 and this SEQRA Expanded EAF submission comprise the Application for MSV1.

MSV1 will have a footprint of approximately 652,000 SF with five stories and a total floor area of approximately 3.2 million SF. Accessory features proposed for MSV1 include guard shacks; car parking spaces (including motorcycle parking spaces); trailer stalls and loading docks; water storage tanks; stormwater management practices and improvements; site driveways; lighting, landscaping; signage; and other related improvements. Once constructed, operational activities will take place within the proposed building in a secured environment that is not open to the public.

Access to and from Project Site will occur from three driveways along Route 5S. Primary access by passenger vehicles only would be provided from the center driveway, across from the eastern driveway from the existing Target distribution facility. BMG proposes to install a new traffic signal at this driveway intersection, with the addition of a new left-hand turn lane onto the Site, which will improve traffic conditions on Route 5S once the Project is operational. To the west of the primary driveway, a second driveway for trucks will provide a stop-controlled, full-movement intersection with Route 5S. The third driveway, to the east of the primary driveway, will be stop-controlled and provide right-in/right-out access only. This driveway will primarily be used by passenger vehicles, however, it will also be used for trucks leaving the Project Site during limited seasonal peak periods. Overall, it is anticipated that this design will reduce potential impacts from the Project on the Route 5S corridor and adjacent properties by providing efficient access and appropriate on-site circulation.

To connect MSV1 to public water and sewer, new service laterals will be connected to the existing Town of Florida water and sewer mains along Route 5S. The Project Site is located within existing water/sewer districts. Water will be provided to the Project for both potable and fire service purposes.

MSV1 will be built on vacant lands between Route 5S and I-90. As described above, traffic from the Project would enter onto Route 5S, an established east/west state highway with a connection to I-90 via N.Y.S. Route 30 ("Route 30") approximately 1.5 miles away to the east of the Site through a mostly commercial corridor. MSV1's layout is oriented towards I-90, with the building and parking areas located as far away from adjoining properties as possible. As discussed below, through the Project's design, including site layout, set-backs, architecture and landscaping, impacts to surrounding lots and the environment will be minimized while supporting the Town's long-term planning objectives to locate commercial/industrial development in the C-2 zoning district along the Route 5S corridor next to I-90.

Overall, MSV1's location and proposed use are entirely consistent with official planning goals where the Project Site is located. The Site is in the C-2 zoning district, where MSV1 is an allowed use that is encouraged by the Town of Florida's adopted Comprehensive Plan.

PROJECT CONFORMANCE WITH SITE PLAN REVIEW STANDARDS

The Project has been designed to conform with the Town of Florida standards for Site Plan Review as set forth in Zoning Ordinance § 22 as follows:

A. Legal Conformance with the provisions of the Local Laws and Ordinances of the Town, the Town Law of New York State, and all applicable rules and regulations of State and Federal agencies.

The Project is designed in accordance with the Town of Florida Zoning Ordinance and other agency requirements. The applicant is seeking approvals from the Town as well as all other agencies with discretionary approvals.

B. Traffic Convenience and safety of both vehicular and pedestrian movement within the site and in relationship to adjoining ways and properties.

The Project's site design is intended to facilitate vehicular circulation and safe pedestrian movement on the site, along with adequate and safe access to and from Route 5S. A traffic study was prepared to evaluate potential traffic impacts from the Project. The study concluded that surrounding intersections would operate adequately after construction of the Project and recommended improvements without any significant traffic impacts. The following improvements were recommended: (a) a new signalized intersection between the Project's center driveway, Route 5S and the existing eastern driveway for the Target distribution center; and (b) a dedicated westbound left-turn lane of 400 feet into the Project's center driveway. These improvements will improve traffic conditions at the Project's new center driveway, which will be used for passenger vehicles entering and leaving the Project Site.

C. Parking Provision for off-street loading and unloading of vehicles incidental to the normal operation of the establishment, adequate parking, adequate lighting, and internal traffic.

Ample parking is provided for trucks and employee vehicles on the Site consistent with the requirements set by the Town of Florida Zoning Board of Appeals pursuant to the Zoning

Ordinance. Lighting for safety designed to have minimal environmental impact is also part of the design. The Project's photometric plan shows little to no light spillage off the Site from the Project.

D. Public Services Reasonable demands placed on public services and infrastructure.

Public water and sewer will be provided for the Project with minimal impact. Truck traffic from the Project will use Routes 5S/30, state-maintained highways, for travel, resulting in no impact from heavy trucks on local roads maintained by the Town. No other costs for municipal services provided by the Town are expected. Nor is the Project expected to result in the addition of significant numbers of students to local schools, as employees are primarily expected to be drawn from the Town and nearby communities within commuting distance of the Project Site. Finally, a state-of-the-art fire suppression system for the Project's building will limit potential burdens on the Florida Volunteer Fire Department.

E. Pollution Control Adequacy of methods of sewage and refuse disposal and the protection from pollution of both surface waters and groundwater. This includes minimizing soil erosion both during and after construction.

Public sewer service will be provided to the Site and solid waste from the Project will be collected on a regular basis for off-site disposal by a private disposal company. The Project will be designed, constructed and operated in compliance with a Stormwater Pollution Prevention Plan (SWPPP) which meets the regulations and standards of the NYS Department of Environmental Conservation ("NYSDEC"). The SWPPP will ensure that surface waters are protected from contamination including erosion of sediments during construction.

F. Nuisances Protection of abutting properties and town amenities from any undue disturbances caused by excessive or unreasonable noise, smoke, vapors, fumes, dust, odors, glare, storm water runoff, etc.

MSV1 will not result in any nuisance conditions or undue disturbances nearby properties or town amenities. As with the 2019 Project, no significant adverse noise, odor or light impacts are expected from MSV1. During construction, any noise and odor impacts from construction equipment will be temporary, of short duration and non-significant. MSV1, when operational, is not anticipated to generate any odor impacts and any noise and lighting impacts will be substantially mitigated so that no significant adverse impacts will occur.

Noise

During construction, blasting would occur during the initial phases of MSV1's construction in order to establish necessary elevation grades for the building and other improvements. This blasting will be very limited in duration during the first several months of construction. All blasting during construction would be performed pursuant to a program developed by a qualified geotechnical engineer to minimize impacts, including noise. Proposed measures to reduce potential noise from blasting include only conducting blasting activities during weekday working hours and not blasting when weather conditions, including wind direction, are unfavorable for avoiding noise impacts. No sensitive receptors, including residences, are located within 500 feet

of where blasting will occur on the Project Site. Notwithstanding, prior notice of planned blasting activities will be provided to all landowners within 500 feet of the overall Project Site's boundaries.

To evaluate potential onsite noise impacts based upon MSV1's proposed operations, BMG conducted a sound study (the "Sound Study") that demonstrates that the Project will comply with NYSDEC's noise guidelines and have no adverse impact on nearby residential uses. The Project Site is uniquely situated adjacent to I-90 and the Project's layout is purposefully oriented to be as far away as possible from residential uses to the north and east of the Project Site. This distance is a critical factor for reducing potential noise impacts from the Project. Also, the Sound Study found that existing ambient sound levels are heavily affected by the constant noise of passing traffic on Route 5S and I-90.

The Study also evaluated the potential for off-site noise impacts from MSV1 due to increased traffic based upon the TIS. This offsite sound study demonstrates that the projected noise impacts from increased traffic will not have any significant adverse impact on the residential or other sensitive receptors along the Routes 5S/30 commercial/industrial corridor between the Project Site and I-90. Specifically, based upon NYSDEC's noise guidance, the supplemental study found that all receptors would not experience any significant adverse impact from sound levels as compared to existing ambient conditions.

Odors

With respect to Odors, MSV1 is not anticipated to result in more than minimal impacts during construction and operation. During construction, any odor impacts from construction equipment will be temporary, of short duration and non-significant. MSV1, when operational, is not anticipated to generate any odor impacts and any odor impacts from mobile sources will be consistent with existing traffic along the Routes 5S/30 commercial/industrial corridor.

Light

Similarly, MSV1's lighting will not result in any significant adverse impacts. New, dark-sky compliant, modern and energy-efficient lighting will be used throughout the Project Site. See Appendix 4, Site Plans. Exterior site lighting will comply with the Zoning Ordinance and be the minimum necessary while ensuring a safe and secure facility. All proposed lighting will be downward facing and will minimize sky glow and light pollution from the Project Site. Where appropriate, lighting fixtures will be of a full cutoff type or provided with shields to reduce glare and light pollution. All fixture locations have been sited to avoid any light trespass onto adjacent properties. These measures have been incorporated to minimize otherwise potential adverse impacts from site lighting of the new building and parking facilities. Though MSV1 involves a taller building, mitigation measures including interior blinds will be employed to ensure that any higher windows do not contribute to new lighting impacts.

Stormwater

There are no existing stormwater controls on the Project Site. By contrast, the Project will greatly improve this condition by collecting and treating stormwater as required by NYSDEC's stormwater regulations and standards. The peak rate of stormwater run-off from the Site, after

construction of the new stormwater controls, will be the same or less as the current rate of run-off from the Site. The Project will provide an environmental benefit by improving stormwater treatment on the Site over existing conditions.

G. Existing Vegetation Minimize the area over which existing vegetation is to be removed. Where tree removal is required, special attention shall be given to planting of replacement trees.

The Project has been designed to minimize the removal of existing vegetation to the maximum extent possible and to maximize the planting of landscaping. Post-construction, large areas of the Project Site will remain vegetated or will be planted with new vegetation, including trees. Approximately 12 acres of forest, 15 acres of wetlands and 11 acres of meadows are expected to remain, with a total of approximately 56 acres of the Site expected to be vegetated after construction of the Project.

H. Amenities The applicant's efforts to integrate the proposed development into existing landscape through design features, such as vegetative buffers, roadside plantings, and the retention of open space and agricultural land.

The Project includes a proposed landscaping plan to soften the visual appearance of the Project along with the retention of existing forest, wetlands and meadows as described above. The Project will add new landscaping around the perimeter of the Site as well as new landscaped islands in the parking lots to help improve the Site's appearance. Existing open space and wetland areas between I-90 and the Project will be maintained and remain undisturbed.

I. Town Character The building setbacks, area and location of parking, architectural compatibility, signage, and landscaping of the development, and how these features harmonize with the surrounding landscape and the natural landscape.

The Project's design complies with all area requirements provided by the Town's Zoning Ordinance and no variances are required. Signage will comply with the Town of Florida Zoning Ordinance. Parking areas on the Site will be reused in generally the same location and upgraded and improved. As discussed above, new landscaping will be added to the Site. The building design addresses aesthetic and architectural considerations through building improvements intended to be consistent with neighboring commercial and industrial buildings.

MSV1 conforms to the existing and planned character of the area where the Project Site is located. The Project will be located on lands in the C-2 district between Route 5S and I-90 and across Route 5S from the IBP district. There is existing commercial and industrial development in the C-2 district to the east and west of the Project Site and two warehouse/distribution centers in the IBP district to the north of the Site across Route 5S, with I-90 bounding the Project Site to the south. Further, in the C-2 district where the Site is located, new residential uses are not allowed, so no further development of homes may occur there. In this context, MSV1 is entirely consistent with, and will improve, the immediately surrounding C-2 zoning district's primarily nonresidential community character.

PROJECT CONFORMANCE WITH SPECIAL PERMIT STANDARDS

The Project conforms with the Town of Florida standards for Special Permit review set forth in Zoning Ordinance § 26 as follows:

1. That all proposed structures, equipment, or material shall be readily accessible for fire and police protection.

Based on the Project's site plans, all elements of the Project will be readily accessible for fire and police protection.

2. That the proposed use is of such location, size, and character that, in general, it will be in harmony with the appropriate and orderly development of the district in which it is proposed to be situated and will not be detrimental to the orderly development of adjacent properties in accordance with the zoning classification of such properties.

The Project will be consistent with the character of the C-2 district where the Project Site is located. The Site in is entirely within the C-2 district between Route 5S and I-90 and across Route 5S from the IBP district. There is existing commercial and industrial development in the C-2 district to the east and west of the Project Site and two warehouse/distribution centers in the IBP district to the north of the Site across Route 5S, with I-90 bounding the Project Site to the south. Further, in the C-2 district where the Site is located, new residential uses are not allowed, so no further development of homes may occur there. In this context, MSV1 is entirely consistent with the existing C-2 zoning district's primarily nonresidential community character. Finally, in 2019, the Planning Board conditionally approved a 1,000,000 SF warehouse/distribution center on the Project Site. The development of the Site by the Project is thus in harmony with the west to east progression of development of the C-2 Commercial District, together with the north to south development of the area comprised of the C-2 and IBP districts, targeted by the Town's Comprehensive Plan for industrial and commercial development.

3. That, in addition to the above, in the case of any use located in, or directly adjacent to a residential district: (a) The location size of such use, the nature and intensity of operations involved in or conducted in connection therewith, its site layout and its relation to access street shall be such that both pedestrian and vehicular traffic to and from the use and the assembly of persons in connection therewith will not be hazardous or incongruous with, the said residential district or conflict with the normal traffic or the neighborhood and use of adjacent land and buildings or diminish the value thereof. (b) The location and height of buildings and structures, the location, nature, and height of walls and fences, and the nature and extent of screening and landscaping on the site shall be such that the use will not hinder or discourage the appropriate development.

The Project Site is not located in or directly adjacent to a residential district. It is bounded by C-2 Commercial District lands to the east and west, IBP District lands to the north, and I-90 and Agricultural District lands to the south.

APPENDIX 20

MSV1 AMAZON DISTRIBUTION FACILITY ("MSV1")

Disadvantaged Communities Report

April 24, 2025

Executive Summary

The purpose of this report is to assess, for purposes of the Planning Board's SEQRA review as the designated lead agency, whether MSV1 will have a significant adverse impact on pollution in the designated disadvantaged community (the "DAC") that is within ½ mile of the Project Site and includes the primarily commercial and industrial travel corridor along N.Y.S. Routes 5S ("Route 5S") and 30 ("Route 30") between the Site and the U.S. Interstate 90 ("I-90") interchange that automobiles and trucks from MSV1 will predominantly use. Based on the analysis below, MSV1 will not result in any significant adverse pollution impacts on the DAC.

Project Description

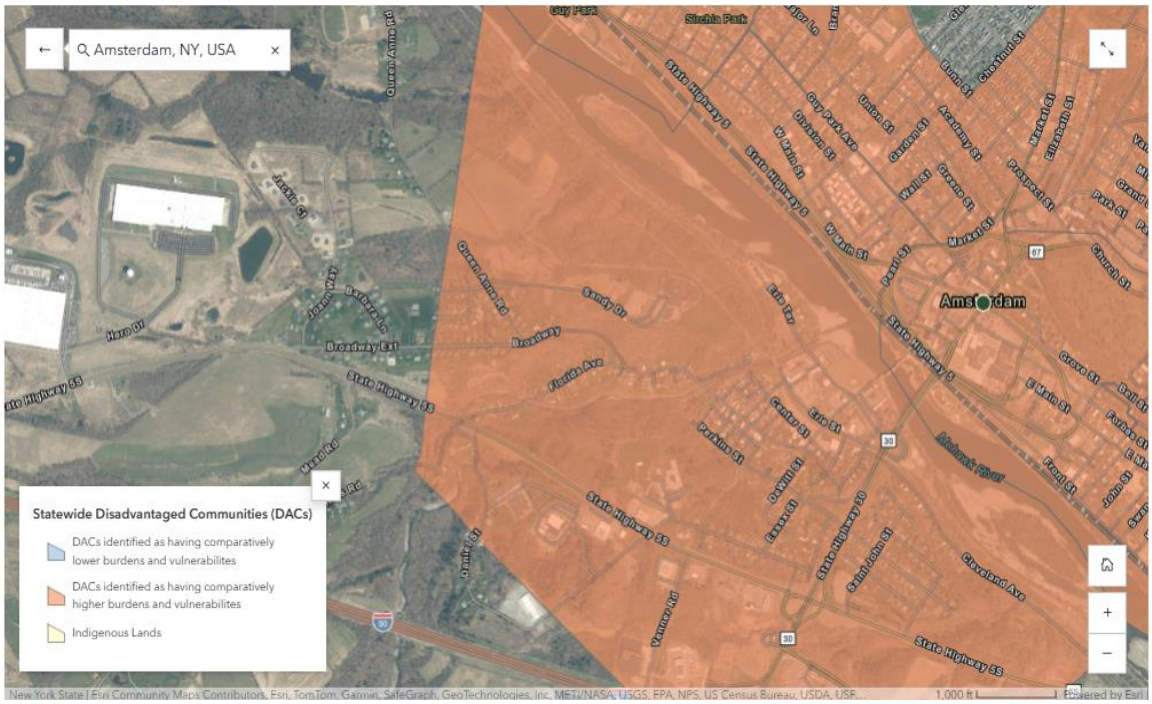
BMG Albany, LLC ("BMG") is proposing to develop property between N.Y.S. Route 5S ("Route 5S") and the New York State Thruway ("I-90") with an e-commerce logistics, storage and distribution facility on lands comprising approximately 137.24± acres in the Town of Florida (the "Town"), Montgomery County, New York (the "Project" or "MSV1"). The Project will be served by a new electric substation (the "Substation") to be separately owned by the user and operated by National Grid pursuant to an easement. The Project will be entirely built in the Town's Commercial ("C-2") zoning district on SBL # 54-1-36 (the "Project Site"), where warehouse/distribution centers are an allowed use subject to Special Permit and Site Plan approvals by the Town of Florida Planning Board (the "Planning Board") pursuant to the Town's Zoning Ordinance. Accordingly, to meet the needs of a new, specific user, BMG applied to the Planning Board for approval of MSV1 in January 2025, which together with a supplemental submission on February 20, 2025 and this SEQRA Expanded EAF submission comprise the Application for MSV1.

MSV1 will have a footprint of approximately 652,000 square feet ("SF") with five stories and a total floor area of approximately 3.2 million SF. Accessory features proposed for MSV1 include guard shacks; car parking spaces (including motorcycle parking spaces); trailer stalls and loading docks; water storage tanks; stormwater management practices and improvements; site driveways; lighting, landscaping; signage; and other related improvements. Once constructed, operational activities will take place within the proposed building in a secured environment that is not open to the public.

Access to and from Project Site will occur from three driveways along Route 5S. Primary access by passenger vehicles only would be provided from the center driveway, across from the eastern driveway from the existing Target distribution facility. BMG proposes to install a new traffic signal at this driveway intersection, with the addition of a new left-hand turn lane onto the Site, which will improve traffic conditions on Route 5S once the Project is operational. To the west of the primary driveway, a second driveway for trucks will provide a stop-controlled, full-

movement intersection with Route 5S. The third driveway, to the east of the primary driveway, will be stop-controlled and provide right-in/right-out access only. This driveway will primarily be used by passenger vehicles, however, it will also be used for trucks leaving the Project Site during limited seasonal peak periods. Overall, it is anticipated that this design will reduce potential impacts from the Project on the Route 5S corridor and adjacent properties by providing efficient access and appropriate on-site circulation.

To connect MSV1 to public water and sewer, new service laterals will be connected to the existing Town of Florida water and sewer mains along Route 5S. The Project Site is located within existing water/sewer districts. Water will be provided to the Project for both potable and fire service purposes.



MSV1 will be built on vacant lands between Route 5S and I-90. As described above, traffic from the Project would enter onto Route 5S, an established east/west state highway with a connection to I-90 via Route 30 approximately 1.5 miles away to the east of the Site through a commercial corridor. MSV1's layout is oriented towards I-90, with the building and parking areas located as far away from adjoining properties as possible. As discussed below, through the Project's design, including site layout, set-backs, architecture and landscaping, impacts to surrounding lots and the environment will be minimized while supporting the Town's long-term planning objectives to locate commercial/industrial development in the C-2 zoning district along the Route 5S corridor next to I-90.

Overall, MSV1's location and proposed use are entirely consistent with official planning goals where the Project Site is located. The Site is in the C-2 zoning district, where MSV1 is an allowed use that is encouraged by the Town of Florida's adopted Comprehensive Plan.

Designated Disadvantaged Community

New York's Climate Leadership & Community Protection Act ((“CLCPA”), New York Environmental Conservation Law Article 75, established the Climate Justice Working Group (‘CJWG”) comprised of representatives from environmental justice communities, the New York State Departments of Environmental Conservation, Health and Labor, and the New York State Energy and Research Development Authority. The CJWG was charged with developing criteria for identifying disadvantaged communities and developing a list of such communities in New York State.

Portions of the Town of Florida near the Project Site and including MSV1's primary traffic route along Routes 5S/30 to I-90, have been designated by the CJWG as a disadvantaged community. The DAC includes a portion the C-2 zoning district established by the Town for commercial and industrial uses where the Project Site is located and where no new residential uses are allowed. The C-2 district comprises the vast majority of the land along the Route 5S corridor. The DAC also includes a small portion of the R-1 residential zoning district along Route 30. The DAC for this area is shown on the following map obtained from the online Disadvantaged Community Assessment Tool provided by NYSDEC:

DAC and SEQRA Review

For the Planning Board's review of the Project pursuant to the New York State Environmental Quality Review Act, ECL Article 8, and its implementing regulations in 6 NYCRR Part 617 (collectively, "SEQRA"), this report evaluates the potential impacts of the Project on the DAC where the Project Site is located, which also includes the primary travel corridor along Route 6 and Route 17M through which Project traffic will travel.

Effective in December 2024, legislative changes to the SEQRA law addressed the need for consideration of DACs through the addition of the following **bolded** language in ECL § 8-0109(4):

> "As early as possible in the formulation of a proposal for an action, the responsible agency shall make an initial determination as to whether an environmental impact statement need be prepared for the action. **In making such determination for any proposed action the responsible agency shall consider whether such action may cause or increase a disproportionate pollution burden on a disadvantaged community that is directly or significantly indirectly affected by such action.** When an action is to be carried out or approved by two or more agencies, such determination shall be made as early as possible after the designation of the lead agency."

"Pollution," as the term is used in the new language added to ECL § 8-0109(4), has the same definition as provided in ECL §1-0303(19):

> "'Pollution' shall mean the presence in the environment of conditions and or contaminants in quantities of characteristics which are or may be injurious to human, plant or animal life

or to property or which unreasonably interfere with the comfortable enjoyment of life and property throughout such areas of the state as shall be affected thereby."

NYSDEC has recently introduced proposed amendments to its SEQRA regulations in 6 NYCRR Part 617 to implement this new statutory provision. The proposed amendments to the SEQRA regulations would require agencies, in making a determination pursuant to 6 NYCRR § 617.7(7)(c) as to whether a project may result in a significant adverse impact to the environment, to consider whether the project:

"may cause or increase a disproportionate pollution burden on a disadvantaged community that is directly or significantly indirectly affected by such action."

NYSDEC has also proposed a draft addition to Parts 1 and 2 of the existing Full Environmental Assessment Form ("FEAF") for DACs. NYSDEC's proposed addition to the FEAF Part 1, which is used by applicants to describe a proposed SEQRA action, has been completed below for MSV1:

E.4. Disadvantaged Communities Designated Pursuant to ECL Article 75

a. Is the project located within, or within ½ mile of, a disadvantaged community? ☒Yes ☐No

If No, could impacts from the project affect a disadvantaged community? ☐Yes ☐No

If Yes to either question in E.4.a, answer the remaining questions in this section.

b. Will there be direct or indirect impacts that may affect a disadvantaged community, such as those listed below? ☒Yes ☐No

i. new noise sources or expansions/modification of existing noise sources;
   - noise from operational sources
   - noise from construction activities
ii. emissions of air pollutants including mobile emissions;
iii. wastewater discharges;
iv. generation of odors;
v. light pollution;
vi. new or modified radiation sources;
vii. new or modified sources of solid waste generation, management, or disposal.

If Yes, describe the impacts: Noise, Air Emissions, Wastewater, Odors, Light

c. Do any of the State agency approvals identified in question B.g include any of the following DEC permits?

State Pollutant Discharge Elimination System (SPDES)	☒Yes	☐No
Solid Waste Management Facility	☐Yes	☐No
Hazardous Waste Management Facility	☐Yes	☐No
Air Pollution Control (Title V or Air State Facility)	☐Yes	☐No
Water Withdrawal over 20 MGD for Cooling Water	☐Yes	☐No
Waste Transporter	☐Yes	☐No

NYSDEC has also proposed an amended FEAF Part 2, which the Planning Board may use to identify potential impacts from MSV1 on the DAC. The draft changes to the FEAF Part 2 would require agencies to identify as a threshold matter whether a project may impact a designated disadvantaged community. If the answer is "yes," agencies must answer several questions regarding whether the project, including its proposed measures to avoid or minimize potential impacts, may have "no to minimal impact" or a "moderate to large impact" on the disadvantaged community. For every potential "moderate to large impact" identified for a proposed action and its measures to avoid or minimize impacts, the agency must then determine and explain whether any remaining impact would potentially be a "significant adverse impact" that requires the

preparation of an environmental impact statement for further evaluation of those impacts. Accordingly, the proposed, amended FEAF Part 2 would add a new Section 19 for agencies to use in their SEQRA review pursuant to 6 NYCRR § 617.7(7)(c) of the potential impacts of a proposed action and its avoidance/minimization measures on disadvantaged communities as follows:

19. Impact on Disadvantaged Communities

The proposed project may impact a disadvantaged community. (See Part 1. E.4) ☐ NO ☐ YES

If "Yes", answer questions a - g . If "No", proceed to Part 3.

	Relevant Part I Question(s)	No, or small impact may occur	Moderate to large impact may occur
a. Is the potentially affected disadvantaged community identified as having comparatively higher burdens or vulnerabilities by the Disadvantaged Community Assessment Tool (https://on.ny.gov/DACAT)?	E.4.c	☐	☐
b. The proposed action may create new air emissions or increase existing air emissions within a disadvantaged community.	D.2.f-i, E.4	☐	☐
c. The proposed action may create new wastewater treatment or discharges, or expand existing wastewater treatment or discharges, within a disadvantaged community.	D.2.d	☐	☐
d. The proposed action creates or expands a solid or hazardous waste management facility, or involves the generation of solid or hazardous waste, within or near a disadvantaged community.	D.2.r, D.2.s, D.2.t, E.1.f, E.1.g	☐	☐
e. The proposed action may increase traffic within a disadvantaged community.	D.2.j	☐	☐
f. The proposed action affects or involves one or more of the following facility types: i. landfill; ii. other industrial, manufacturing, or mining land uses; iii. major oil or chemical bulk storage facility; iv. municipal waste combustor; v. power generation facility; vi. risk management plan site; vii. remediation site; or viii. scrap metal processor.	C.3.c, D.1.a, D.1.g, D.2.a, D.2.d, D.2.f, E.1.a, E.1.b. E.1.h, E.1.v, E.4	☐	☐
g. Other impacts: _____		☐	☐

For the Planning Board's SEQRA review of the potential impacts of MSV1 on the DAC, this report follows NYSDEC's proposed new regulations in 6 NYCRR Part 617 and the proposed amendments to FEAF Parts 1 and 2, including guidance on how to implement the proposed amendments for disadvantaged communities that NYSDEC has provided in the proposed SEQRA rulemaking package (https://dec.ny.gov/sites/default/files/2025-01/part617risguidanceappc.pdf.). For the reasons discussed below, BMG respectfully submits that MSV1 will not have a significant adverse impact on the DAC.

FEAF Part 1 – Potential Direct or Indirect Impacts from MSV1 on the DAC

As noted above, the Project Site is located within ½ mile of the DAC. The Project has the potential for the following moderate to large "pollution" impacts on the DAC referenced in the proposed FEAF Part 1 completed by BMG above for MSV1:

1. Noise from construction and operational activities, including noise on the Project Site and from truck traffic traveling to and from the Site along Routes 5S/30 to I-90; and
2. Air emissions during construction and operation, including onsite air emissions and from mobile sources (automobiles and trucks) traveling to and from the Site along Routes 5S/30 to I-90.

The Project is not a manufacturing facility, hazardous waste generation or treatment facility or a solid waste management facility. It will not require any DEC air emission permits or air registrations. Pursuant to NYSDEC regulations, any truck idling onsite is not permitted longer than five minutes. Based on the Project's lighting plan, no light spillage will occur off the site and all lights will be downward-directed and dark sky compliant. As noted in the FEAF Part 1, the Project will also generate a limited amount of solid waste, which will be transported offsite and managed and disposed of in accordance with NYSDEC regulatory requirements. As a result, the Project is not anticipated to result in any significant adverse impacts on the DAC from odors or solid waste. The Project will not generate any radiation and its minimal wastewater (from a limited number of restrooms) will be collected, managed and treated by a publicly-owned wastewater treatment plant that is not located on the Project Site or in this DAC and the treated discharge from which is subject to a NYSDEC SPDES permit. Accordingly, no more than minimal direct or indirect impacts on the DAC from the Project are expected from these sources of "pollution."

Stormwater from the Project during construction and operation will be regulated pursuant to NYSDEC's General Permit GP-0-25-001 for stormwater discharges and a stormwater pollution prevention plan (SWPPP). Accordingly, only minimal impacts from these potential sources of "pollution" are reasonably anticipated.

FEAF Part 2 – Evaluation of Potential Impacts from MSV1 on the DAC

The FEAF Part 2 will be completed by the Planning Board for MSV1 and the Board may decide to use NYSDEC's proposed addition to the FEAF Part 2 for disadvantaged communities to facilitate its evaluation of the potential impacts of MSV1 on the DAC. To assist the Planning Board in its SEQRA review of MSV1's potential impacts on the DAC, BMG provides the following recommended responses to the Questions posed in NYSDEC's proposed addition to the FEAF Part 2 for disadvantaged communities:

Question 19(a) – Is the potentially affected disadvantaged community identified as having comparatively higher burdens or vulnerabilities by the Disadvantaged Community Assessment Tool (https://on.ny.gov/DACAT)?

The DAC where the Project is located is identified as having comparatively higher burdens of vulnerabilities by the Disadvantaged Community Assessment Tool.

Question 19(b) – The proposed action may create new air emissions or increase existing air emissions within a disadvantaged community.

To evaluate the potential air quality impacts of MSV1, both at the Project Site and between the Site and the I-90 interchange along Routes 5S/30, BMG prepared an air quality report (the "Study") attached to the SEQRA Expanded EAF Narrative as Appendix 12. The Study estimated

the projected future cumulative emissions from mobile sources (i.e., passenger vehicles and long-haul trucks) using Environmental Protection Agency ("EPA") approved modeling software and the traffic volume projections provided in the Traffic Impact Study ("TIS") for MSV1 discussed below. The TIS considered MSV1's mobile sources and other existing and projected based upon a 2027 expected operational timeframe for the Project. The air quality dispersion modeling results were compared to EPA's National Ambient Air Quality Standards ("NAAQS") to determine if there are potential air quality impacts to nearby sensitive receptors (i.e., local residential areas and schools).

The potential impacts of mobile source emissions on sensitive receptors focused on areas that would also be affected by Project 's mobile sources. Specifically, these areas include the Routes 5S/30 corridor between the MSV1 site and I-90, areas of public access and residential areas along Routes 5S/30. Modelling receptors were conservatively placed along this corridor. The surrounding area was reviewed for sensitive locations, such as schools, hospitals, and nursing homes.

With respect to potential impacts on air quality from MSV1 and existing and projected mobile air emission sources along the Routes 5S/30 corridor to I-90, the Study found that projected emissions associated with mobile sources in 2027, added to background concentrations, would not result in an exceedance of the applicable air quality standards at any receptor locations, including at sensitive receptor locations. This includes from mobile sources operating on MSV1's site as well as between the Site and I-90 along the Routes 5S/30 corridor.

In addition to the analysis discussed above, the potential for cumulative air quality impacts from mobile sources on ozone was considered. Ozone is a colorless gas composed of three oxygen atoms, known chemically as O3. It occurs both in the Earth's upper atmosphere and at ground level. Ground-level ozone is a major component of smog and poses health risks to humans, animals, and vegetation. The formation of ground-level ozone is a photochemical process involving precursor pollutants such as NOX and volatile organic compounds ("VOCs").

The Study found that projected emissions of NOx associated with projected mobile sources in 2027, added to background concentrations, would not result in an exceedance of applicable air quality standards and therefore, projected contributions of NOx to the formation of ozone are expected to be minor. Additionally, the Study included consideration of four pollutants which are VOCs. These VOCs are projected to be below the respective regulatory thresholds; therefore, projected contributions of VOCs to the formation of ozone are also expected to be minor.

Accordingly, based on this conservative analysis that considered the potential for cumulative impacts beyond those of MSV1 alone, MSV1 will not result in any significant adverse impacts to air quality in the DAC where the Project is located and through which Project traffic will travel along Routes 5S/30 to I-90.

Question 19(c) – The proposed action may create new wastewater treatment or discharges, or expand existing wastewater treatment or discharges, within a disadvantaged community.

MSV1 will expand existing wastewater treatment or discharges, within a disadvantaged community. Wastewater from the Project will be pumped from the Site through an underground force main through the Town's sanitary infrastructure to the City of Amsterdam wastewater treatment plant, where it will be treated prior to discharge in accordance with a NYSDEC SPDES permit. The Amsterdam plant is located in an adjoining DAC census tract and wastewater discharges are not identified as a significant pollution burden in that DAC. The discharge from Project will not require any pretreatment because it will consist only of sanitary wastewater from a limited number of restrooms. Accordingly, MSV1 will have a minimal impact on the DAC as a result of its expansion of the wastewater discharge at the Amsterdam wastewater treatment plant.

Question 19(d) – The proposed action creates or expands a solid or hazardous waste management facility, or involves the generation of solid or hazardous waste, within or near a disadvantaged community.

As reflected in the FEAF Part 1 provided as Appendix 8 to the SEQRA Expanded EAF Narrative submitted by BMG, MSV1 will not result in the generation of any hazardous waste and will not be a solid waste management facility. Per the FEAF 1, MSV1 will generate an estimated 1-2 tons per month of solid waste during operations that will be hauled offsite and disposed of by a private carting business at a licensed and permitted solid waste management facility subject to NYSDEC permit requirements. No solid or hazardous waste will be disposed of on the Project Site**.**

Question 19(e) – The proposed action may increase traffic within a disadvantaged community.

MSV1 will result in an increase in traffic within the DAC but will not result in any significant adverse impact to the DAC based upon the cumulative Traffic Impact Study ("TIS") included as Appendix 17 to the SEQRA Expanded EAF Narrative for MSV1 and its discussion in Section 13 of the Narrative. Based on the TIS, MSV1's potential for traffic impacts will not have a significant adverse impact on the DAC.

Site access is proposed via three driveway locations along the Project Site's approximately 4,000 feet of frontage on Route 5S. The primary access is the central driveway, proposed to intersect Route 5S opposite Target Drive East, and will be used by passenger vehicles only. This driveway will be full-movement and signalized to improve operational delays. The western driveway will be a stop-controlled full-movement intersection for trucks only. The eastern driveway will be used by passenger vehicles only except during limited seasonal peak periods when outbound site trucks may use it as well. The eastern driveway will be a stop-controlled right-in/right-out only access.

Offsite, the TIS evaluated the potential traffic impact of the Project on the Routes 5S/30 corridor and nearby roadways. Thee TIS analyzed roadway volumes under two conditions, including the "Roadway Peak Hour Condition" and "Generator Peak Hour Condition". Since a

user has been identified for MSV1, actual trip rates based upon staggered employee shift times and operations at other, similar facilities were able to be used for the TIS. This provides more accurate data for purposes of the MSV1 TIS and the Planning Board's review. Since the user's required timing of shift changes and corresponding loading/unloading operations do not correspond to the peak hours for traffic on surrounding roadways, MSV1's traffic impact during the Roadway Peak Hour Condition is reduced. For the Roadway Peak Hour Condition, the weekday morning peak hour of the adjacent roadway system occurs from 7:30 AM to 8:30 AM and the weekday evening peak of the adjacent roadway system occurs from 3:30 PM to 4:30 PM. MSV1 will have two general shifts for employees with peak traffic occurring from 6:30 AM to 7:30 AM and from 5:30 PM to 6:30 PM, representing the Generator Peak Hour Condition.

The TIS conducted a capacity analysis at the following intersections:

- 5S and NYS Route 30 Southbound Ramps / P.S. Street;
- 5S and NYS Route 30 Northbound Ramps;
- NYS Route 30 and Route 5S Ramps;
- NYS Route 30 and I-90 Exit 27 Ramps;
- Route 5S and Target Driveway East / Proposed Central Driveway;
- Route 5S and Proposed West Driveway; and
- Route 5S and Proposed East Driveway.

MSV1 is expected to be operational in 2027, so the TIS analyzes the capacity of local roadways and intersections to handle the addition of MSV1 traffic in 2027 during the Roadway Peak Hour Condition and Generator Peak Hour Condition based on projected future traffic levels. For this analysis, the TIS used current traffic counts and estimated a 1.8% per year increase in future traffic to develop projected "2027 No-Build" traffic volumes that do not include MSV1's anticipated traffic. MSV1's site-generated trips were then added to the 2027 No-Build traffic volumes to provide the 2027 Build traffic volumes. Based on a review of the analysis, with the addition of the improvements recommended in the TIS, the TIS concludes that the adjacent roadway network and proposed driveway system have the capacity to accommodate the anticipated traffic from MSV1 without resulting in any significant adverse impacts. Specifically, with the anticipated addition of MSV1 traffic in 2027, all of the studied intersections (except for the proposed intersection between MSV1's central driveway and Target's eastern driveway on Route 5S) will continue to provide acceptable levels of service without any additional mitigation measures.

Proposed mitigation measures to minimize traffic impacts from MSV1 are only recommended for the proposed intersection of the Project's central driveway and Target's eastern driveway on Route 5S. To improve traffic conditions at this new intersection, a traffic signal will be provided. In addition, the TIS recommends the widening of Route 5S at this intersection to provide a dedicated, 400-foot westbound left turn lane into the Project's central driveway. The TIS has been submitted to NYSDOT for its review and these improvements will be undertaken subject to NYSDOT review and approval.

For the foregoing reasons, MSV1's traffic will not result in any significant adverse impacts on the DAC.

Question 19(f) – The proposed action affects or involves one or more of the following facility types: landfill; other industrial, manufacturing, or mining land uses; major oil or chemical bulk storage facility; municipal waste combustor; power generation facility; risk management plan site; remediation site; or scrap metal processor.

MSV1 will develop vacant lands between Route 5S and I-90 in the C-2 zoning district with an e-commerce logistics, storage and distribution facility, on a Project Site where a warehouse/distribution center use such as the Project is allowed by the Town's Zoning Ordinance and is consistent with the Town's Comprehensive Plan. MSV1's location and proposed use are fully consistent with the community's plans for the C-2 zoning district. MSV1 will be next to I-90 along an existing commercial/industrial corridor on a state highway and in a zoning district purposefully designated by the Town for uses like Project.

All of the lands in the C-2 district are located immediately adjacent to I-90 along Route 5S and to the west of the nearby I-90 interchange, while almost all of the Town lands further away from the interchange are zoned for agricultural and/or residential uses. This land use planning goal is reflected in the Town's Comprehensive Plan. The Project will be located on lands in the C-2 district between Route 5S and I-90 and across Route 5S from the IBP district. There is existing commercial and industrial development in the C-2 district to the east and west of the Project Site and two warehouse/distribution centers in the IBP district to the north of the Site across Route 5S, with I-90 bounding the Project Site to the south.

MSV1 will have minimal impact upon community infrastructure and the benefits that the Project will provide will far exceed the cost of any additional services required as a result of the Project. As proposed, MSV1 will significantly contribute to the achievement of the community's goals through:

- Substantial building permit fees for the Project will be paid to the Town for the Project;
- Creation of a minimum of 300 construction jobs through the construction of the Project;
- Creation of a minimum of 750 permanent jobs with full comprehensive benefits and educational opportunities, plus hundreds of part-time and seasonal jobs;
- Productive use of a vacant site in the C-2 zoning long-targeted for industrial development;
- Significant increase in the taxable value of the Project Site, with a total capital investment in excess of several hundred million dollars;
- Indirect employment resulting from the build-out of Project;
- Local procurement opportunities for small businesses;
- Ancillary economic output due to employment and construction; and
- Positive impact creating substantial new opportunities with fiscal benefits supporting local public schools and community infrastructure.

As discussed above, while the Project's building is taller than the building approved by the Planning Board for the 2019 Project, the potential visual impacts of the Project on nearby residential uses will be lessened by intervening vegetation, along with an attractive architectural design for the Project. Further, due to the location of the Project Site in the C-2 district, some visibility of the Project from surrounding uses is to be reasonably expected.

Based on its design and layout, MSV1 will be consistent with the character of this area of the C-2 district along I-90 and the Town's existing and planned Route 5S commercial/ industrial corridor. The Project Site will be repurposed with a use appropriate to its location in this district, substantially benefitting the Town.

Accordingly, the Project will be consistent with the Town's expectations for the community character of the C-2 district and will not have any significant adverse impact on the DAC.

Question 19(g) – Other "pollution" impacts

For the following reasons and based upon the SEQRA Expanded EAF Narrative and its appendices, MSV1 will not have any significant adverse impacts on the DAC from the following other forms of pollution as follows:

Noise

MSV1's potential for impacts on Noise will not have a significant adverse impact on the DAC.

As with the 2019 Project, no significant adverse noise, odor or light impacts are expected from MSV1. During construction, any noise and odor impacts from construction equipment will be temporary, of short duration and non-significant. MSV1, when operational, is not anticipated to generate any odor impacts and any noise and lighting impacts will be substantially mitigated so that no significant adverse impacts will occur.

During construction, like the 2019 Project, blasting would occur during the initial phases of MSV1's construction in order to establish necessary elevation grades for the building and other improvements. This blasting will be very limited in duration during the first several months of construction. All blasting during construction would be performed pursuant to a program developed by a qualified geotechnical engineer to minimize impacts, including noise. Proposed measures to reduce potential noise from blasting include only conducting blasting activities during weekday working hours and not blasting when weather conditions, including wind direction, are unfavorable for avoiding noise impacts. No sensitive receptors, including residences, are located within 500 feet of where blasting will occur on the Project Site. Notwithstanding, prior notice of planned blasting activities will be provided to all landowners within 500 feet of the overall Project Site's boundaries.

To evaluate potential onsite noise impacts based upon MSV1's proposed operations, BMG conducted a sound study (the "Sound Study") that demonstrates that the Project will comply with NYSDEC's noise guidelines and have no adverse impact on nearby residential uses. See Appendix

18. The Project Site is uniquely situated adjacent to I-90 and the Project's layout is purposefully oriented to be as far away as possible from residential uses to the north and east of the Project Site. This distance is a critical factor for reducing potential noise impacts from the Project. Further, MSV1's loading docks will face away from nearby residences, so the intervening building will block noise associated with truck activities at those loading docks. Also, the Sound Study found that existing ambient sound levels are heavily affected by the constant noise of passing traffic on Route 5S and I-90.

The Study also evaluated the potential for off-site noise impacts from MSV1 due to increased traffic based upon the TIS. See Appendix 17. This offsite sound study demonstrates that the projected noise impacts from increased traffic will not have any significant adverse impact on the residential or other sensitive receptors along the Routes 5S/30 commercial/industrial corridor between the Project Site and I-90. Specifically, based upon NYSDEC's noise guidance, the supplemental study found that all receptors would not experience any significant adverse impact from sound levels as compared to existing ambient conditions.

For the foregoing reasons, the potential impacts of MSV1 on Noise will not result in any significant adverse impact on the DAC.

Odors

With respect to Odors, MSV1 is not anticipated to result in more than minimal impacts to the DAC associated with construction and operation. During construction, any odor impacts from construction equipment will be temporary, of short duration and non-significant. MSV1, when operational, is not anticipated to generate any odor impacts and any odor impacts from mobile sources on the DAC will be consistent with existing traffic along the Routes 5S/30 commercial/industrial corridor.

Light

Similarly, MSV1's lighting will not result in any significant adverse impacts on the DAC. New, dark-sky compliant, modern and energy-efficient lighting will be used throughout the Project Site. See Appendix 4, Site Plans. Exterior site lighting will comply with the Zoning Ordinance and be the minimum necessary while ensuring a safe and secure facility. All proposed lighting will be downward facing and will minimize sky glow and light pollution from the Project Site. Where appropriate, lighting fixtures will be of a full cutoff type or provided with shields to reduce glare and light pollution. As shown on the Site Plans, the fixture locations have been sited to avoid any light trespass onto adjacent properties. These measures have been incorporated to minimize otherwise potential adverse impacts from site lighting of the new building and parking facilities. Though MSV1 involves a taller building, mitigation measures including interior blinds will be employed to ensure that any higher windows do not contribute to new lighting impacts. Also, since the building involves a substantially smaller footprint than the 2019 Project, it is likely that fewer windows overall will be provided.
