### Sound Assessment of Maple Tree Farms

Conducted February 22, 2023

Sound decibel level tested at two different settings. First at a dinner level and second at a dancing level. The first test was conducted with all doors of the barn open and measured at the corner of Mc Dougall Road and Scotch Church Road at full dance level. It was difficult to get an accurate measurement due to birds chirping in nearby trees. The birds chirping caused the meter to register at a higher level than the music. The meter registered at 51.2 decibels with the music at a dance volume which is the highest level,

The second test was conducted at the closest neighbor north of the barn on the Kimber's property located on Mc Dougall Road. This test also was conducted with all barn doors open at a dance music level. Similar to the first test, birds in nearby trees made getting an accurate measurement impossible. The meter registered at 55 decibels.

To put decibel levels in perspective as stated by the CDC. The average whisper is 30 db (decibels). An air conditioner runs at 70 db.
